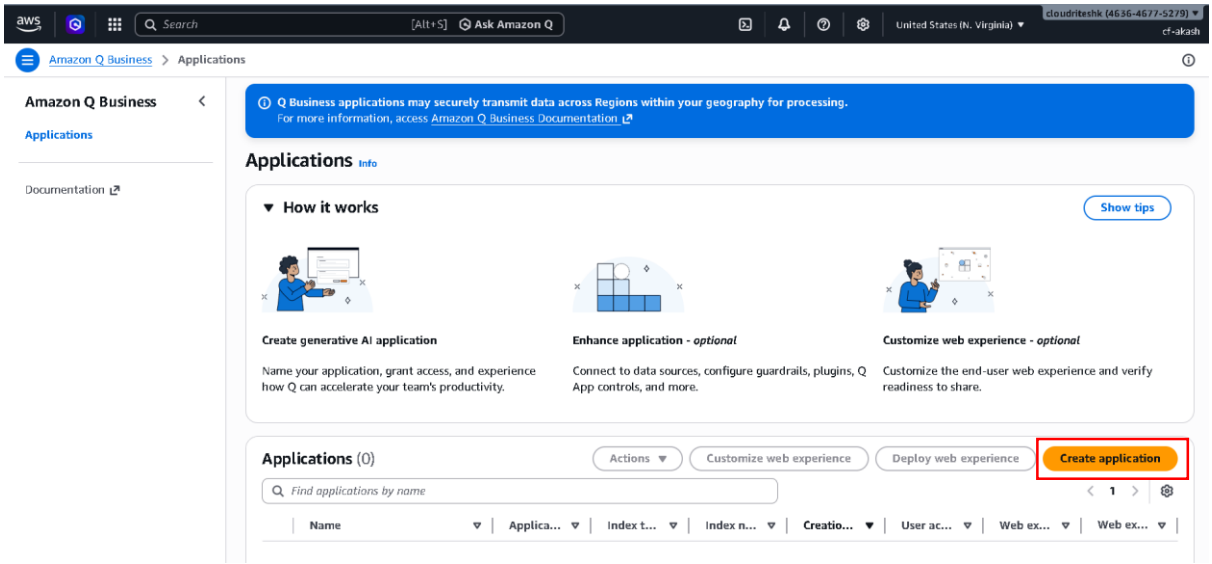
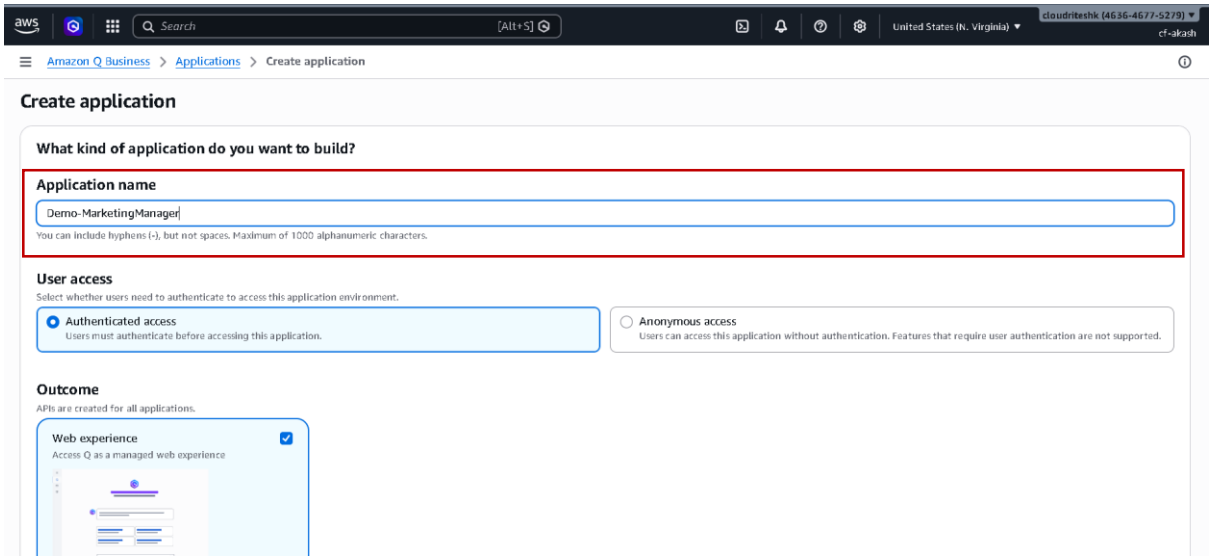
CREATING AMAZON Q BUSINESS APPLICATION (Lec - 24)

Now we are going to Build from Scratch a marketing manager AI Assistant: -

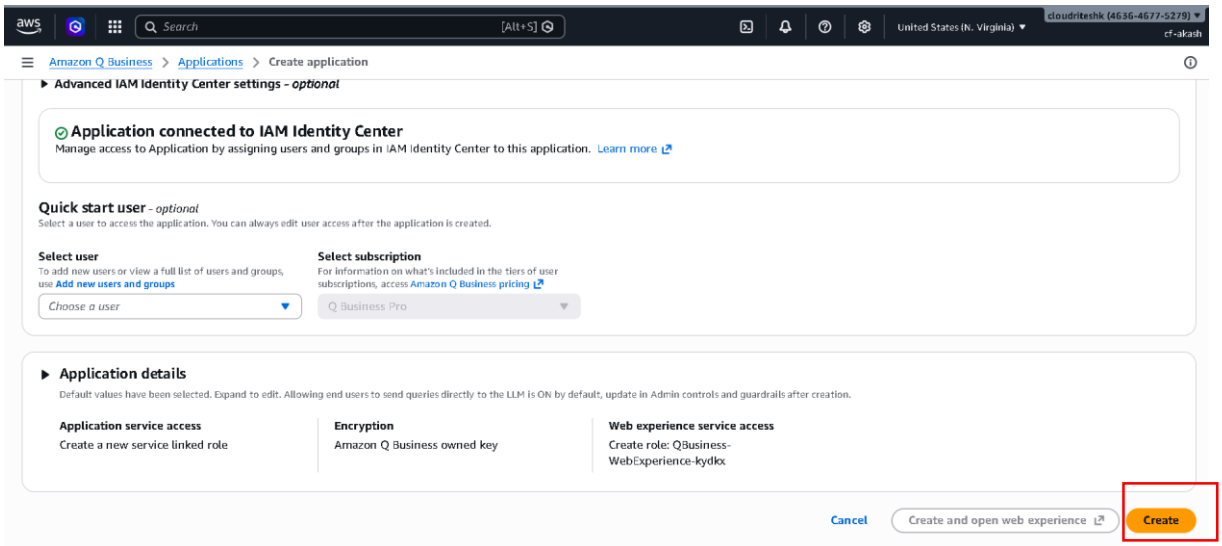
- Go to Amazon console.
- Before Start creating AI Assistant.
- Go to IAM identity Center.
- IAM identity Center. This is your directory to add user and groups to the application that you are going to build.
- Just you need to go and Enable it.
- Now Open new console in new tab and search Amazon Q Business
- Go to Amazon Q Business



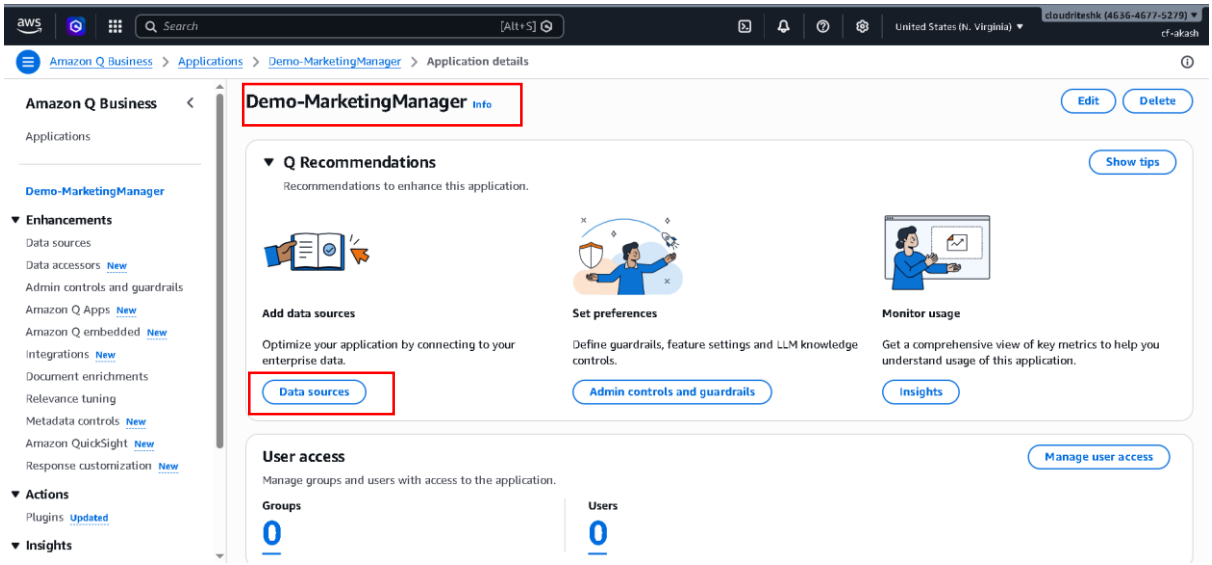
- Now click on Create application
- Enter Application name



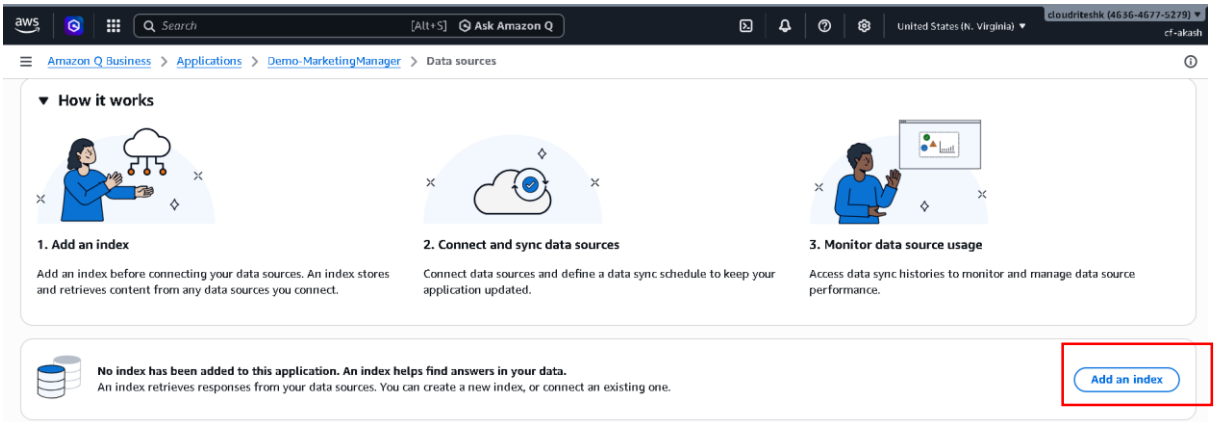
- Keep everything else default
- Now click on create



- Application is created

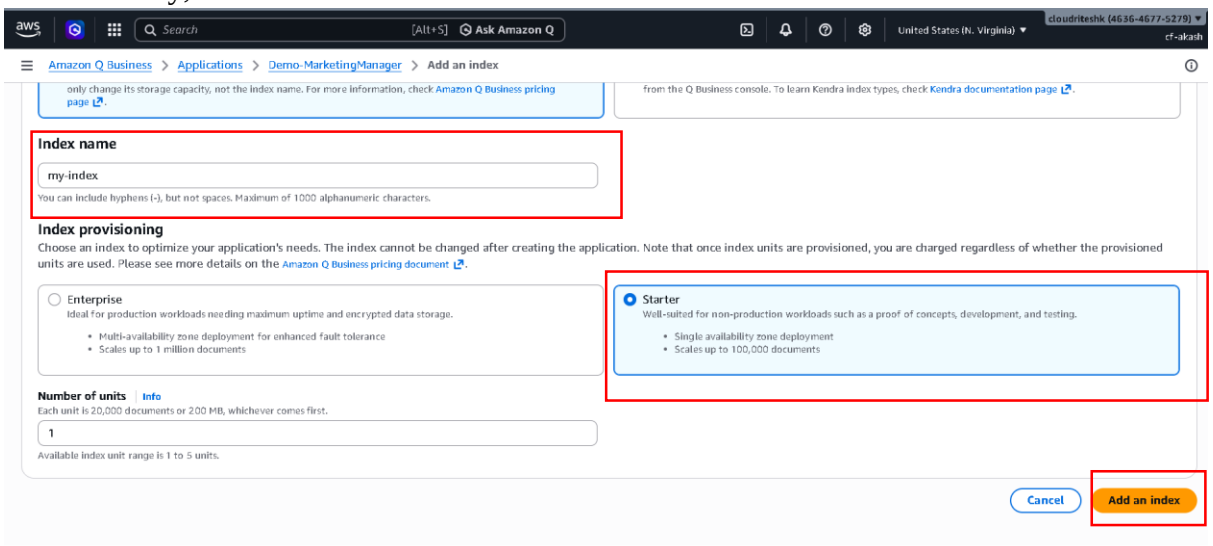


- Now click on Data Source



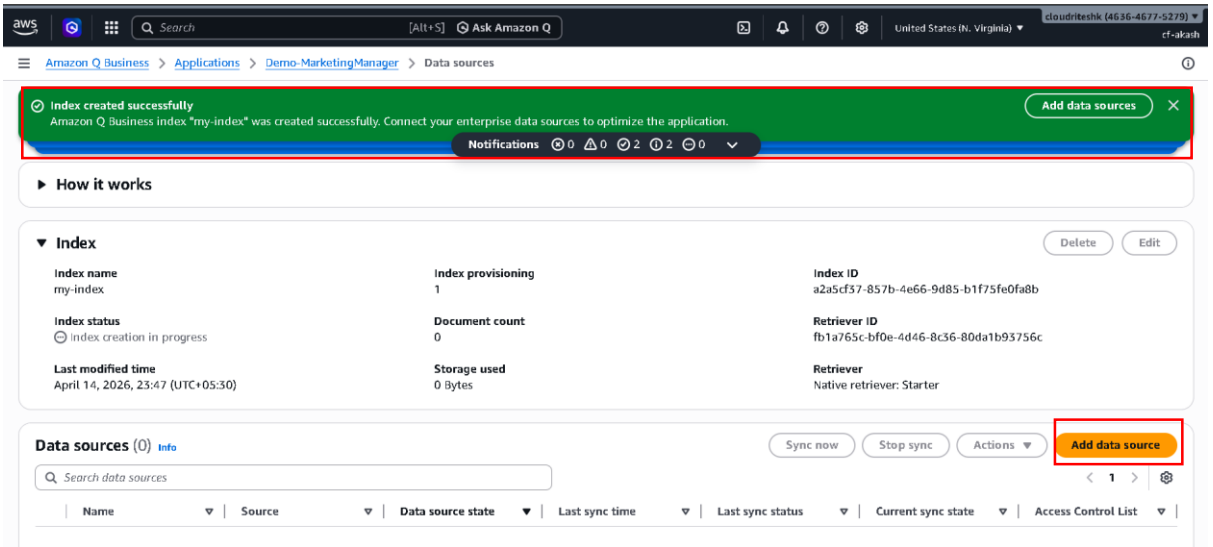
- Data Source is open

- Firstly, click on Add an index



- Now Give index name and choose index provisioning as starter

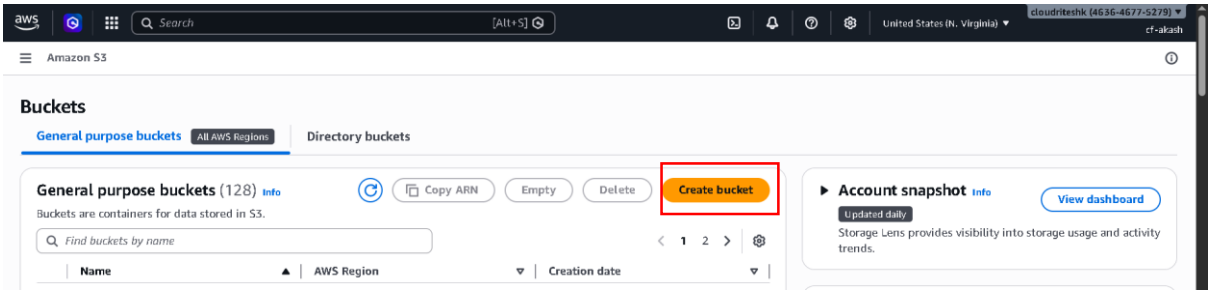
- And click on Add an index

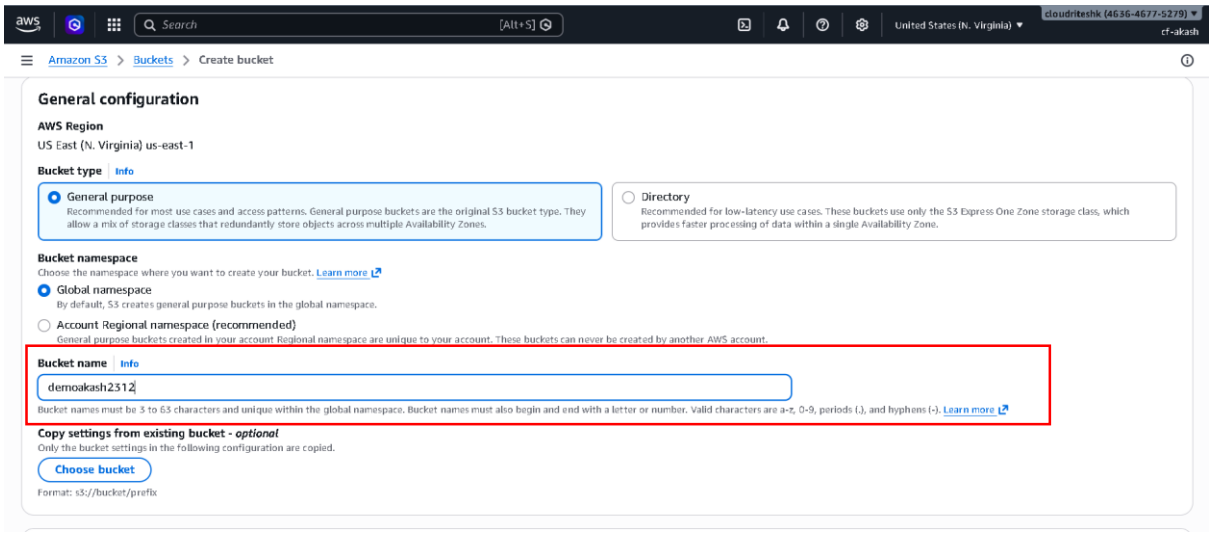


- Before Adding Data source <u>Create S3 Bucket</u>

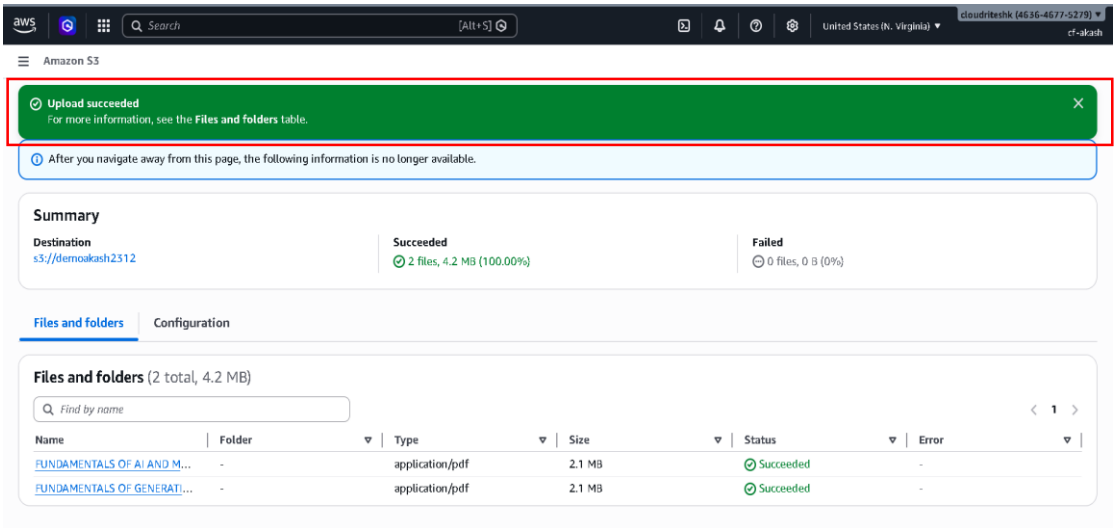
- Go console and search S3 Bucket

- Click on create

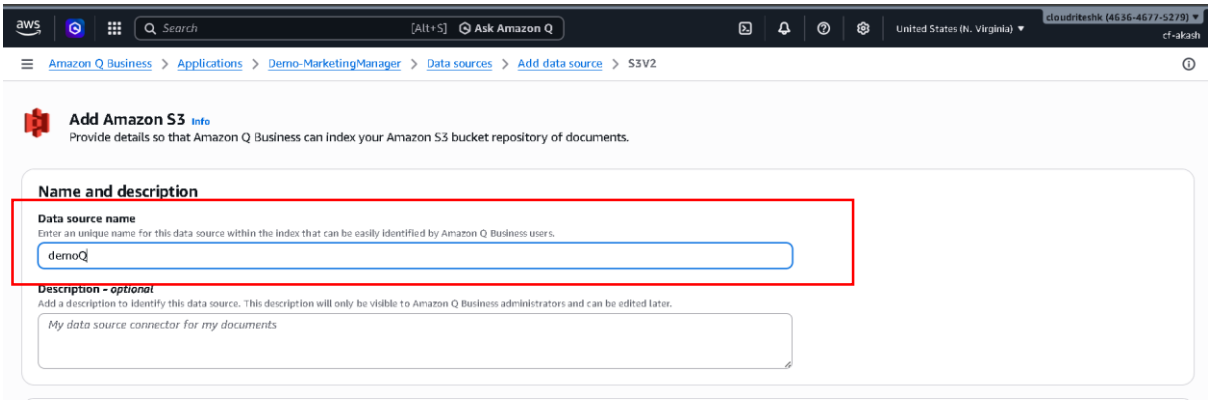




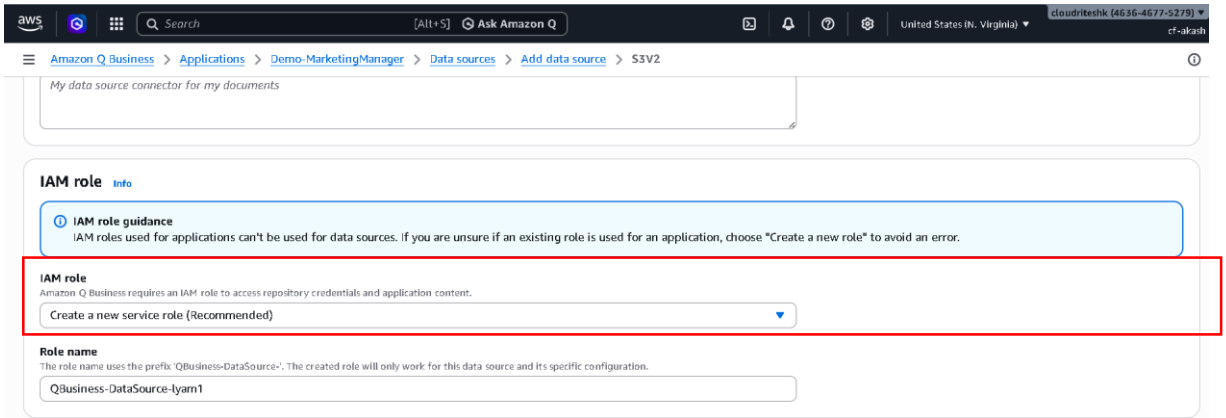
- Enter Bucket Name
- Keep everything else default
- Now click on create in right bottom
- Your S3 Bucket is ready
- Now upload your documents in it



- Documents is uploaded
- Basically you can upload any document according to your app.
- Now again go on Amazon Q Business
- Go to your created application
- And go into add data source
- Your created index in starting
- Know click on Add data source



- Choose Amazon s3
- Now give Data source name



- Choose IAM role
  - Create a new service role (Recommended)

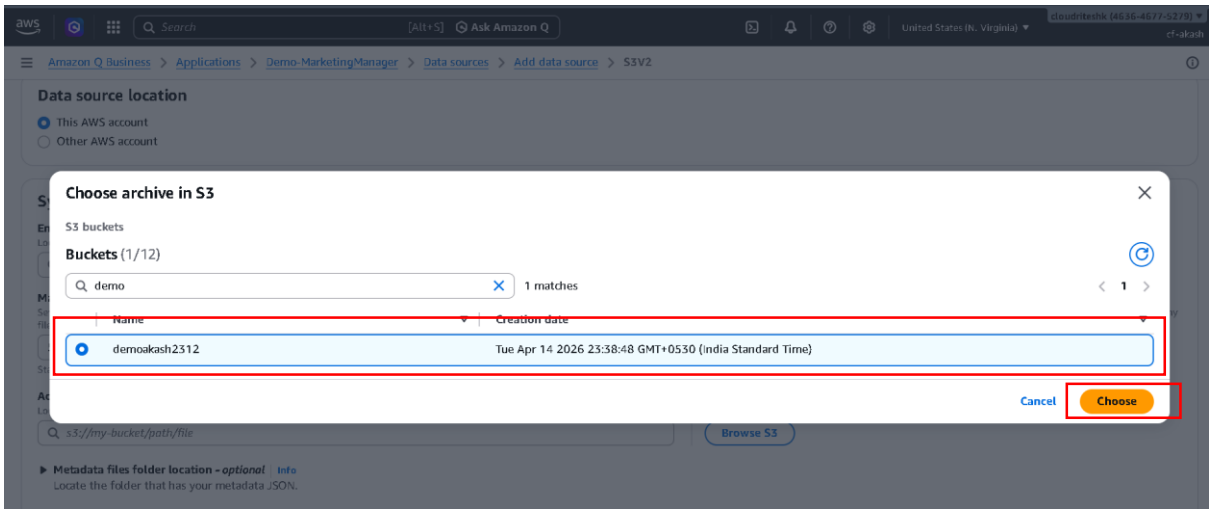
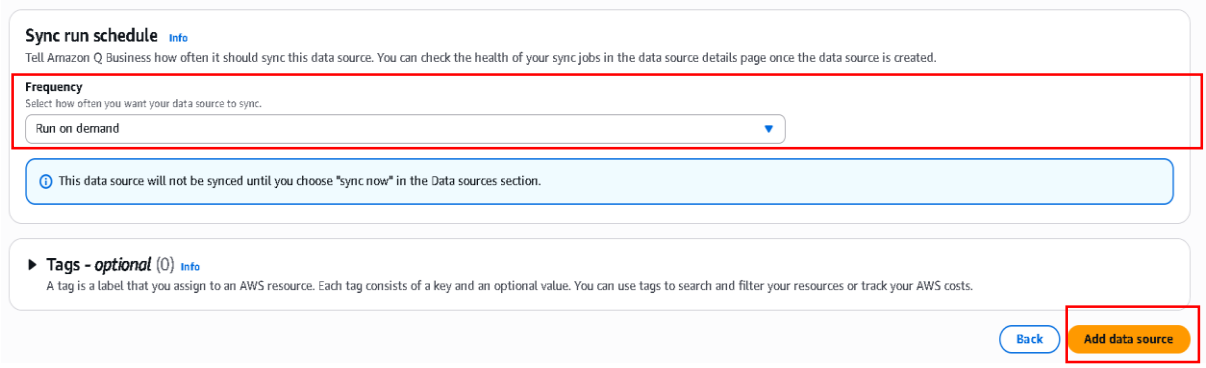
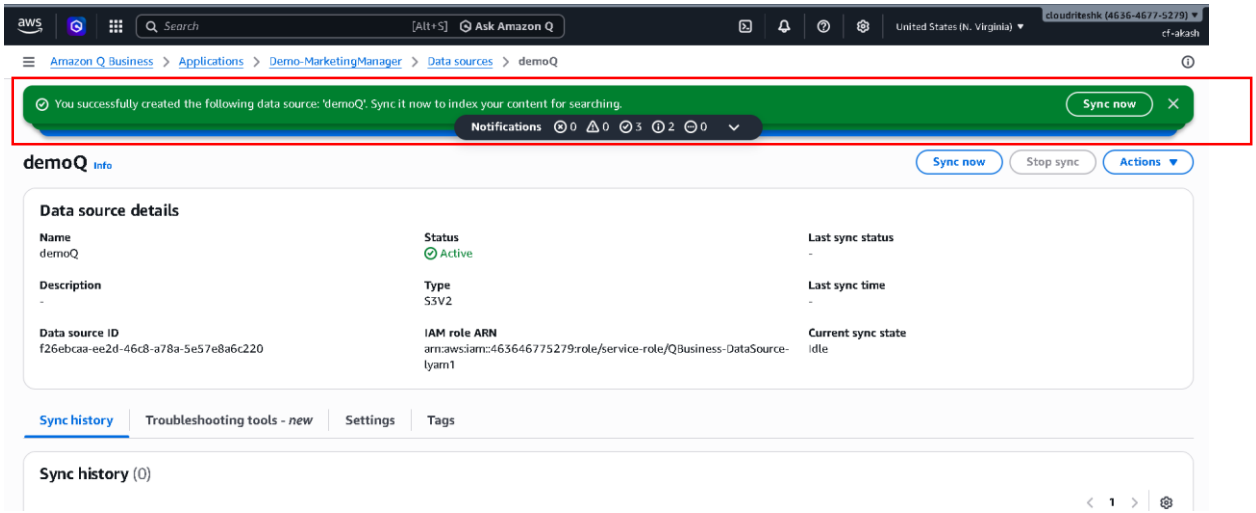
  - Click on Browse S3



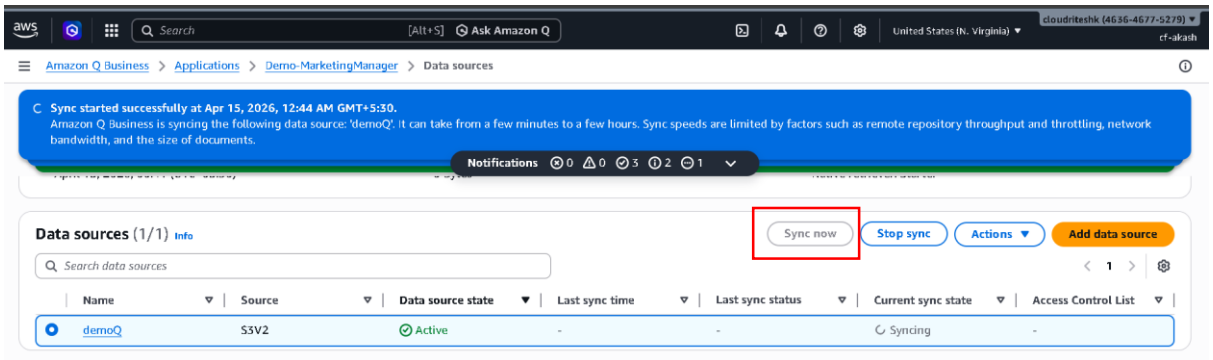
- Now select your created S3 bucket



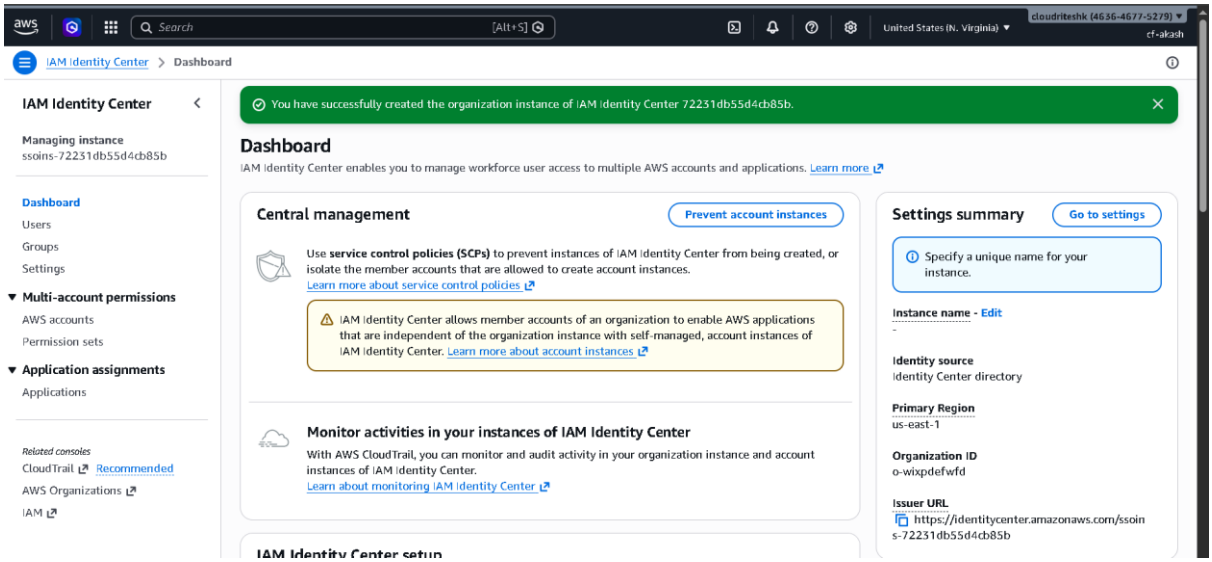
- And click on choose
- Now in Sync run schedule
  - Frequency: - Run on demand
- And in Last click on create data source



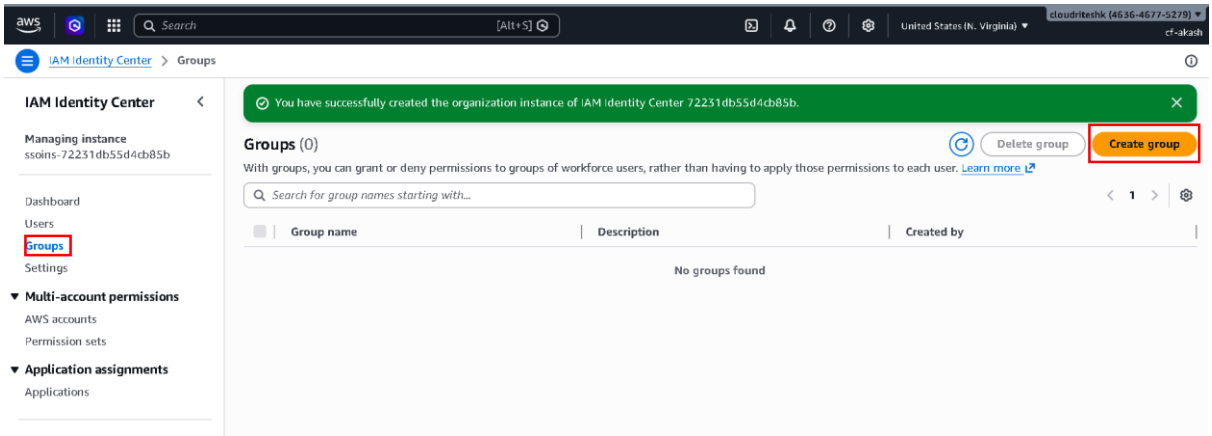
- Now our Data Source is created



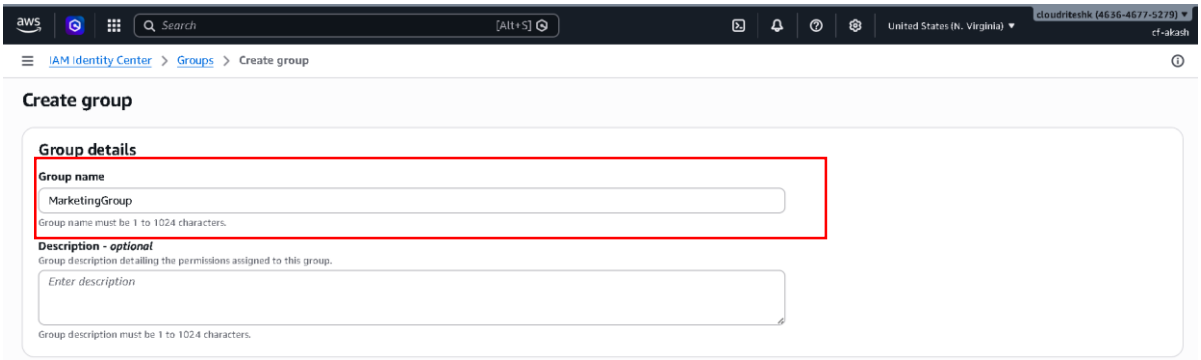
- Now in your data source nothing because it not Sync anything.
- Click on Sync so that they sync data from S3 bucket



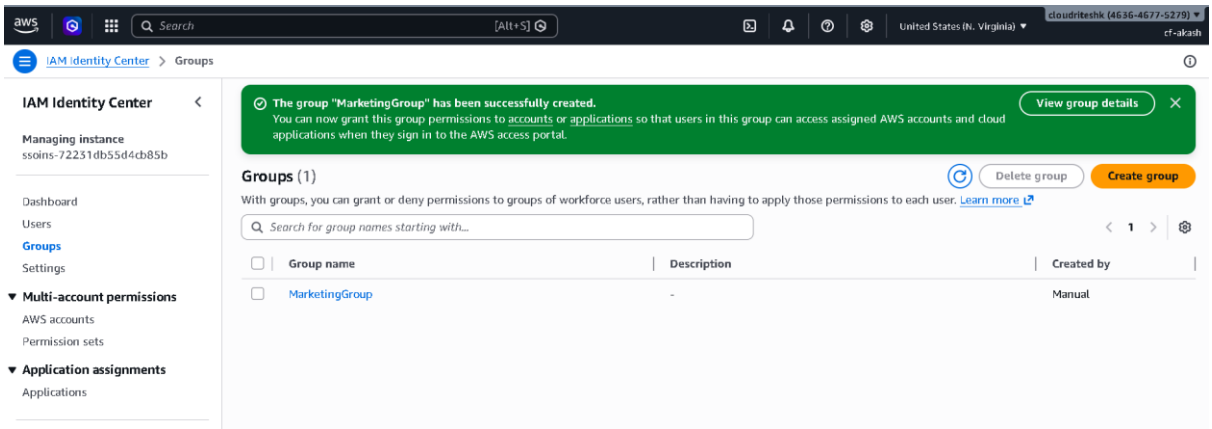
- Now go to IAM identity Center and click on groups



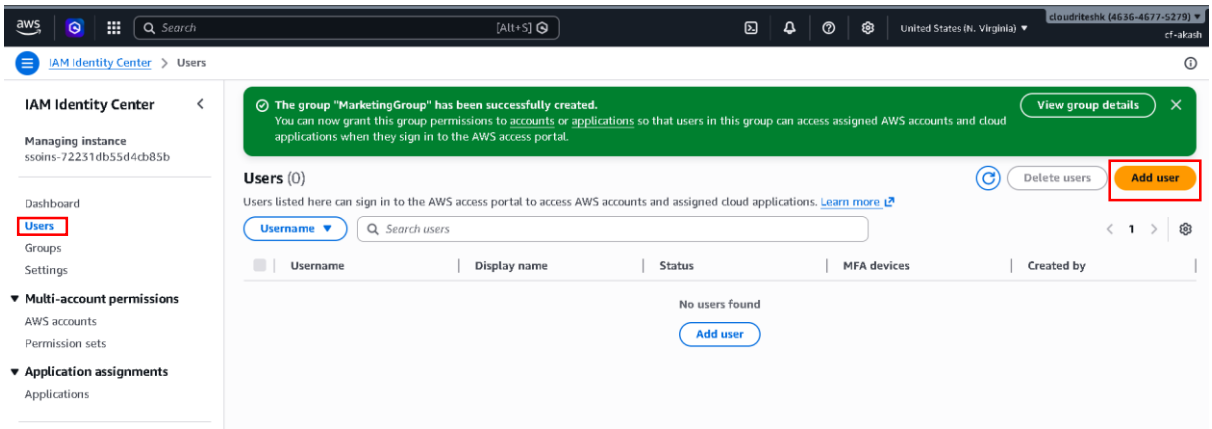
- Now click on create Groups



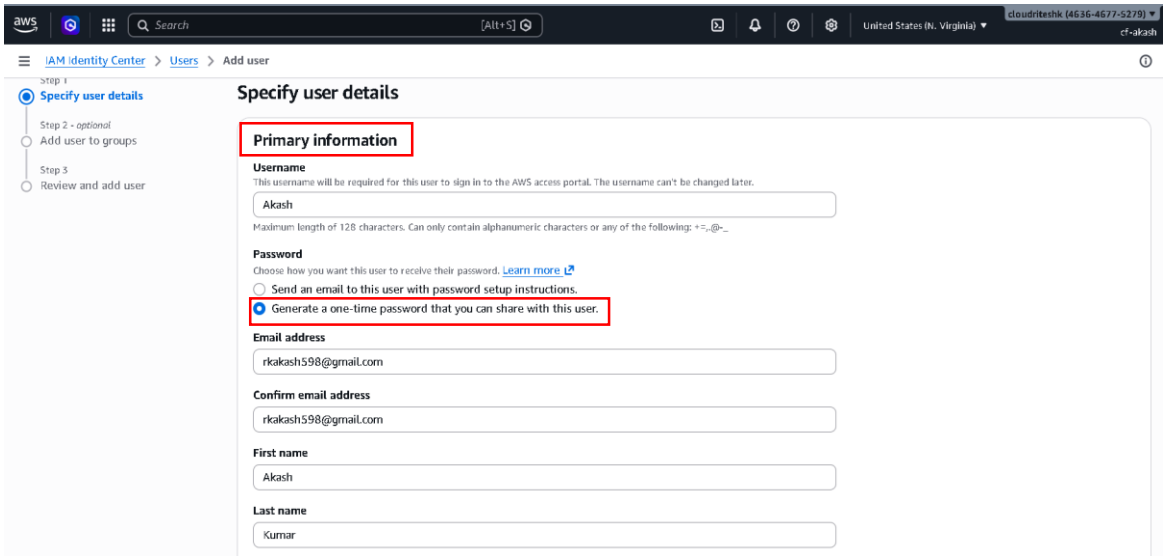
- Enter group name
- Keep everything else default
- And go to bottom and click on create Group



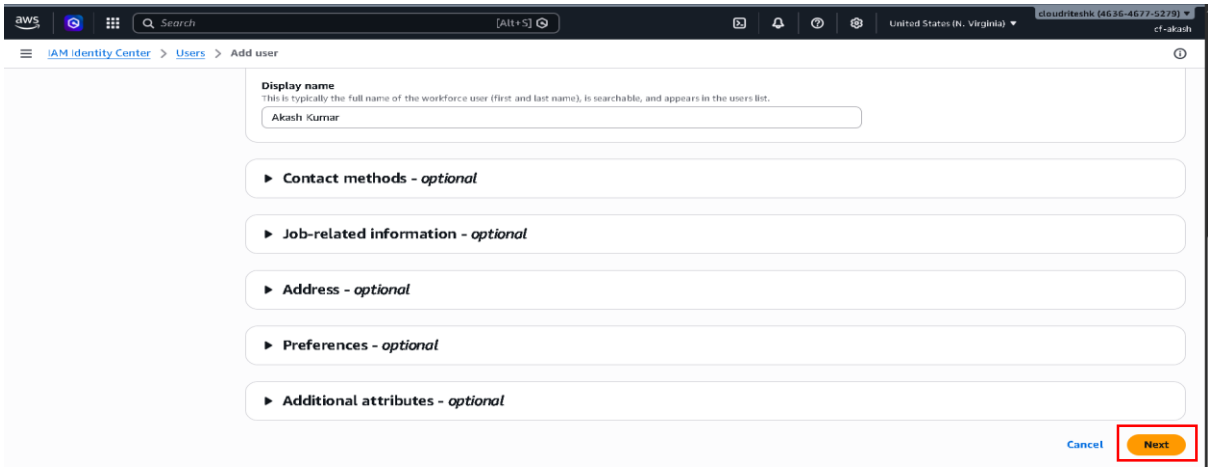
- Group is created
- Now in IAM Identity Center



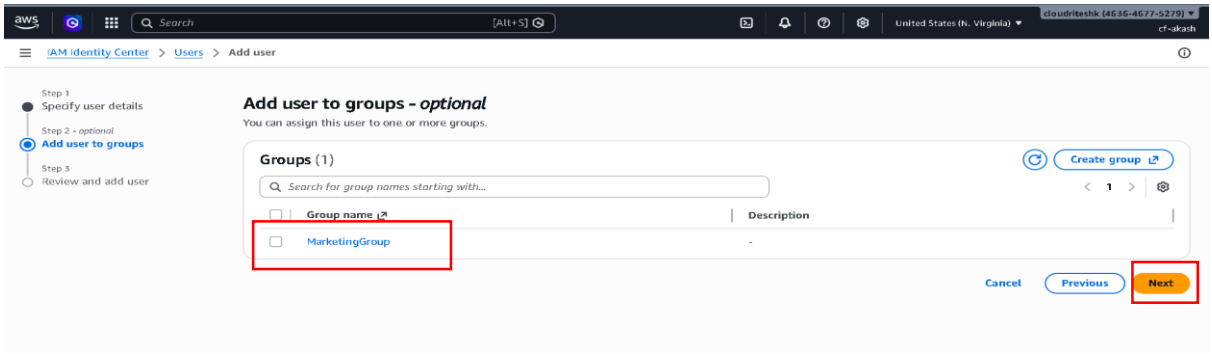
- Click on Add user



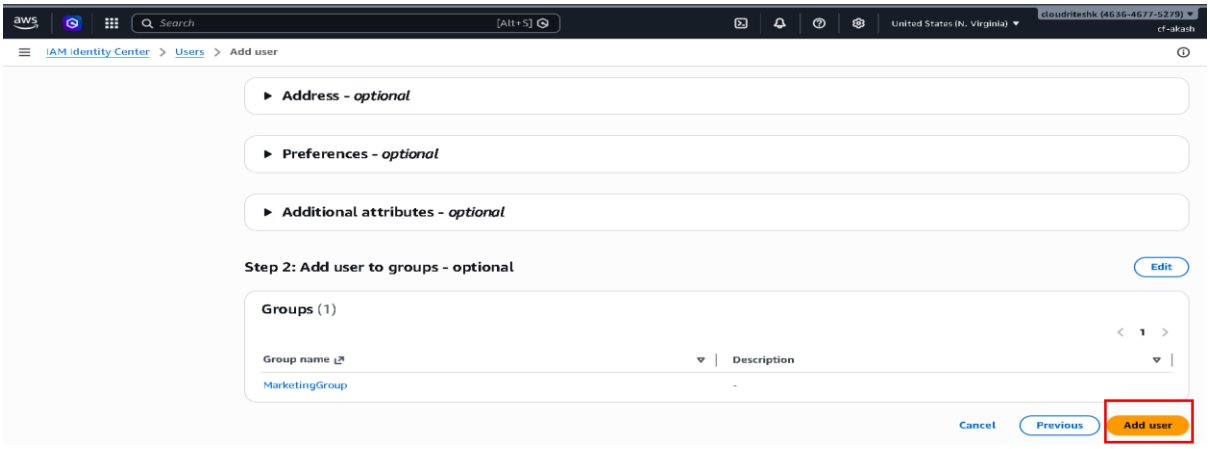
- Enter user details: -
    - Username
    - Password: - choose Generate a one time password
    - Email
    - First Name
    - Last Name



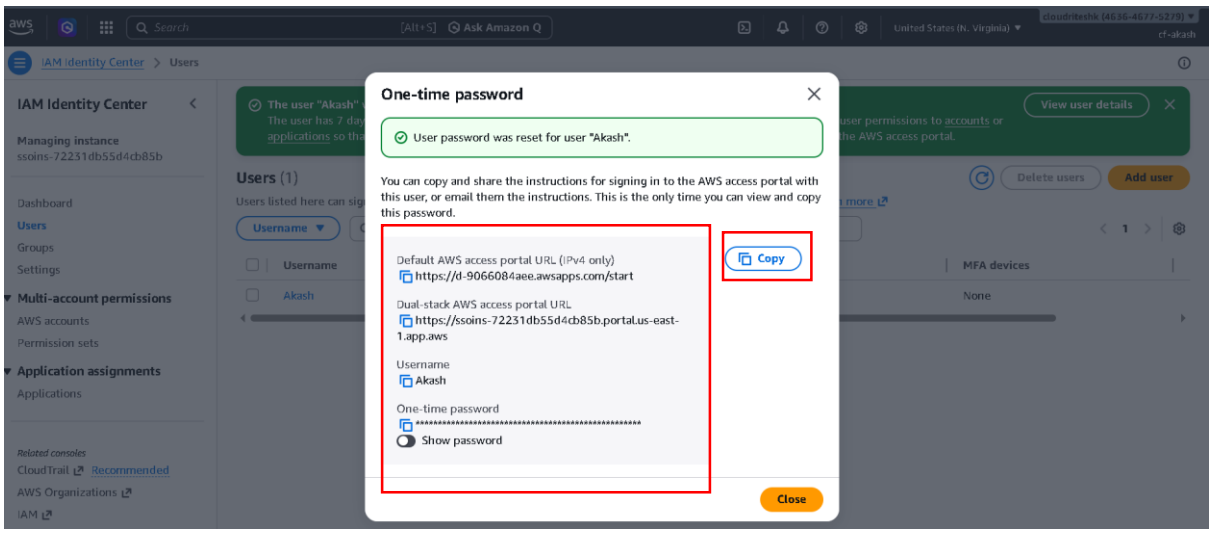
- Click on Next



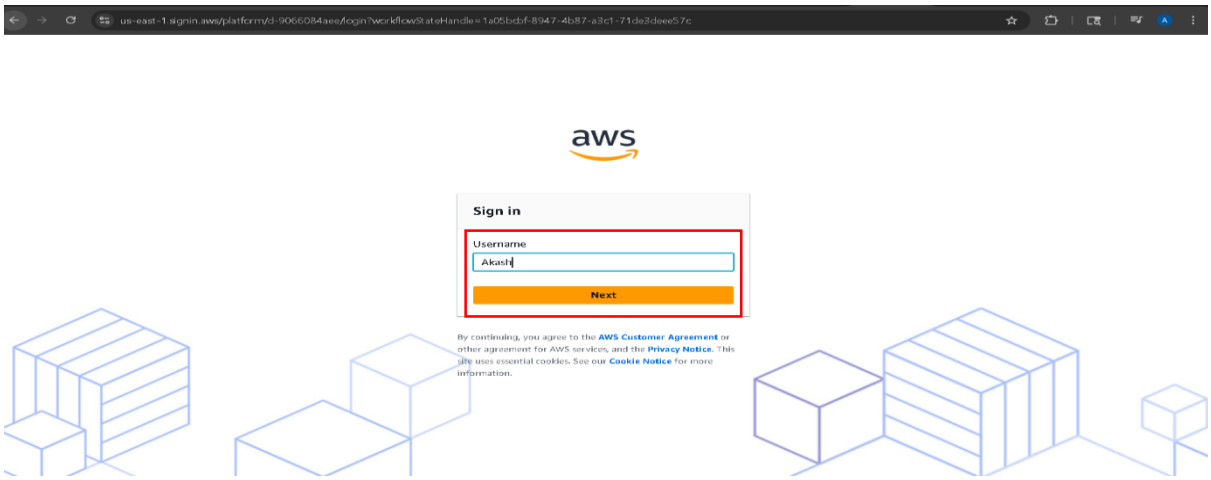
- Add user to created Group
- And click next



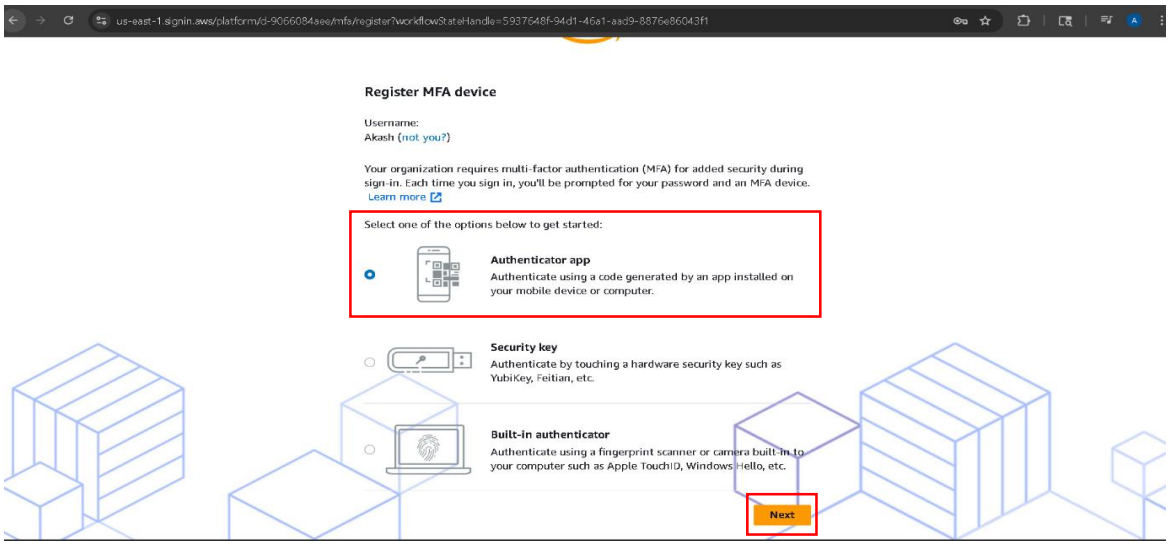
- Now click on Add user



- Now you see it gives Username, Password and URL for accessing the application
- So you can go and check
- Copy URL paste in your browser

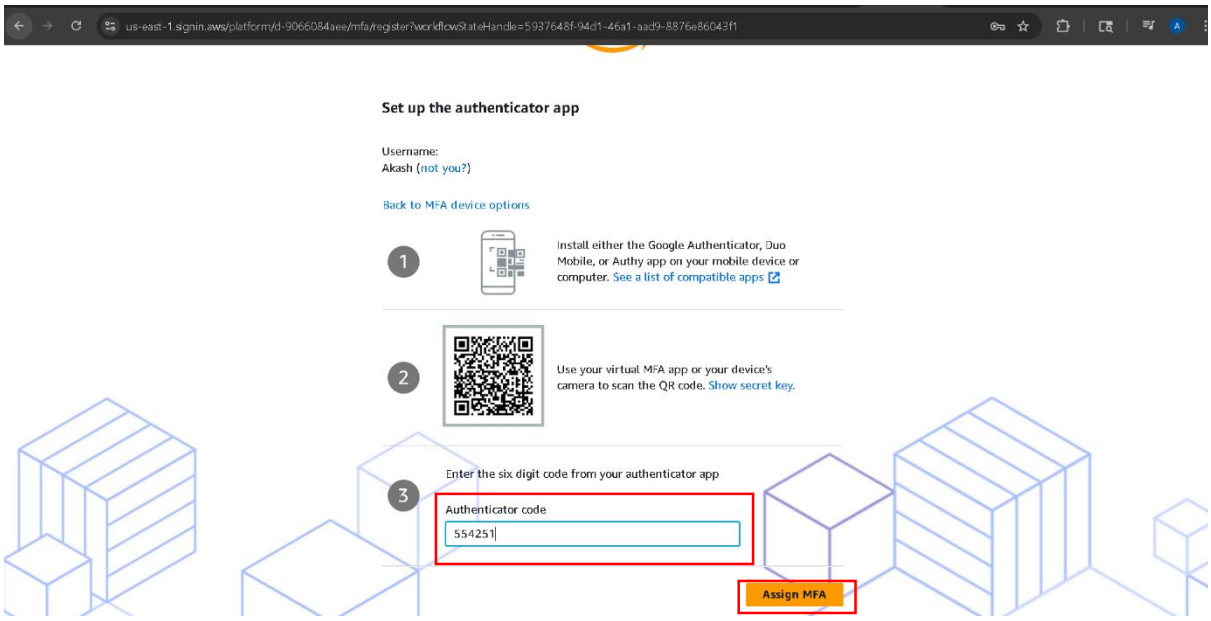


- And enter user name and one time password you get



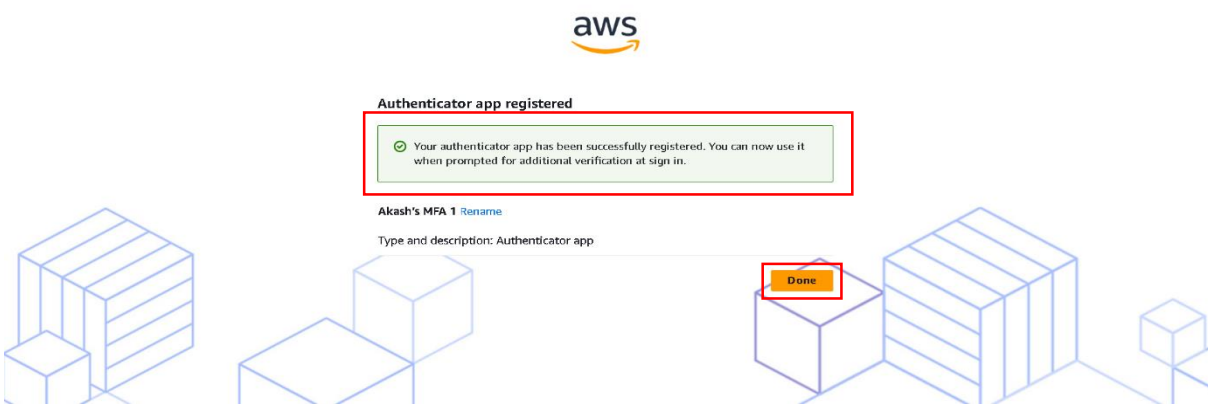
- Now Register MFA Device: -

  - Choose Authentication app: - Google Authenticator

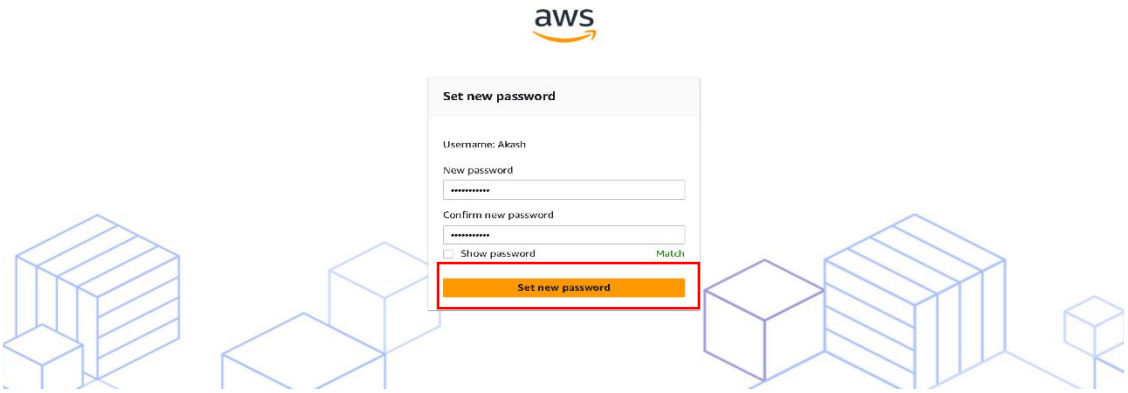


- Now scan QR with Authenticator app From Mobile and Enter Authentication code

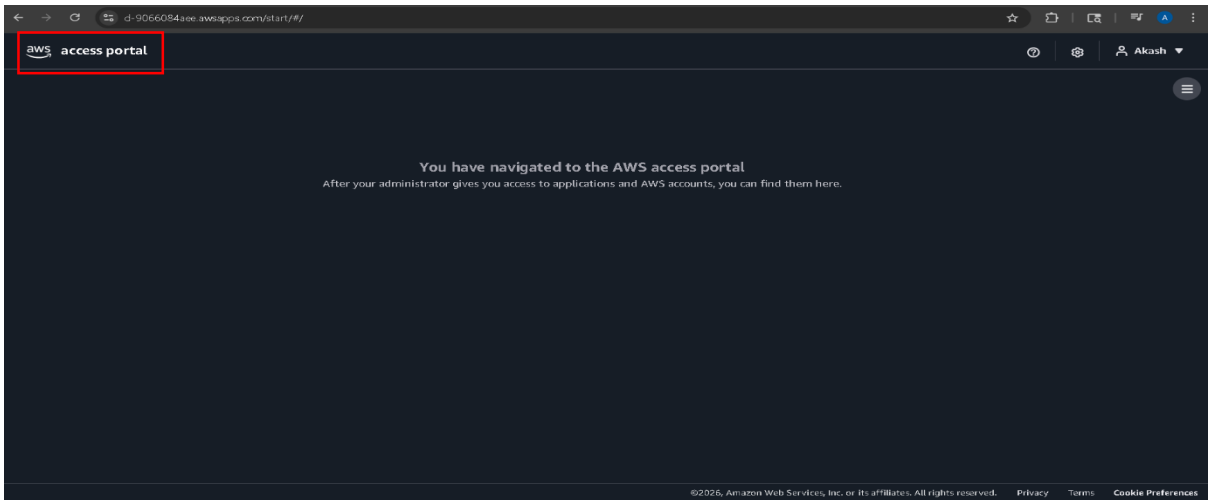
---



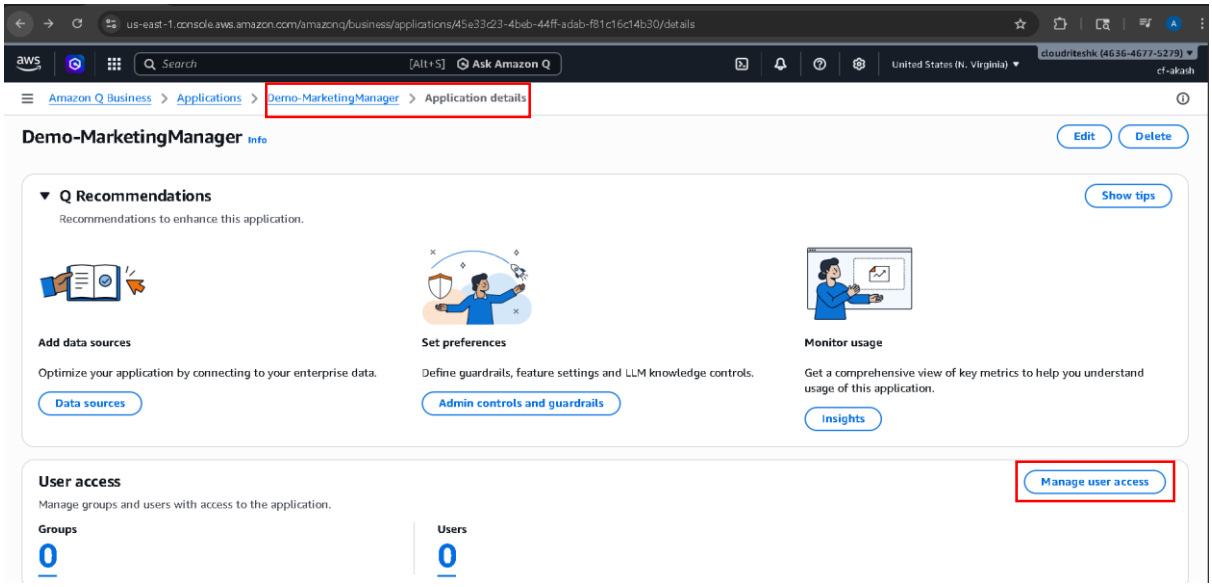
- Now Authenticator is Registered
- Click on done



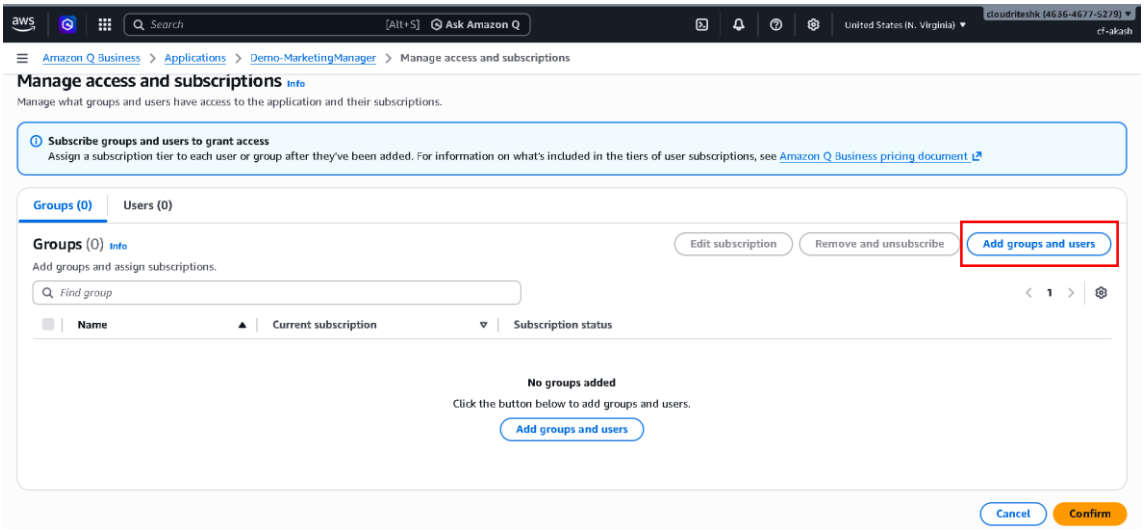
- Now Create New Password
- And click set new Password



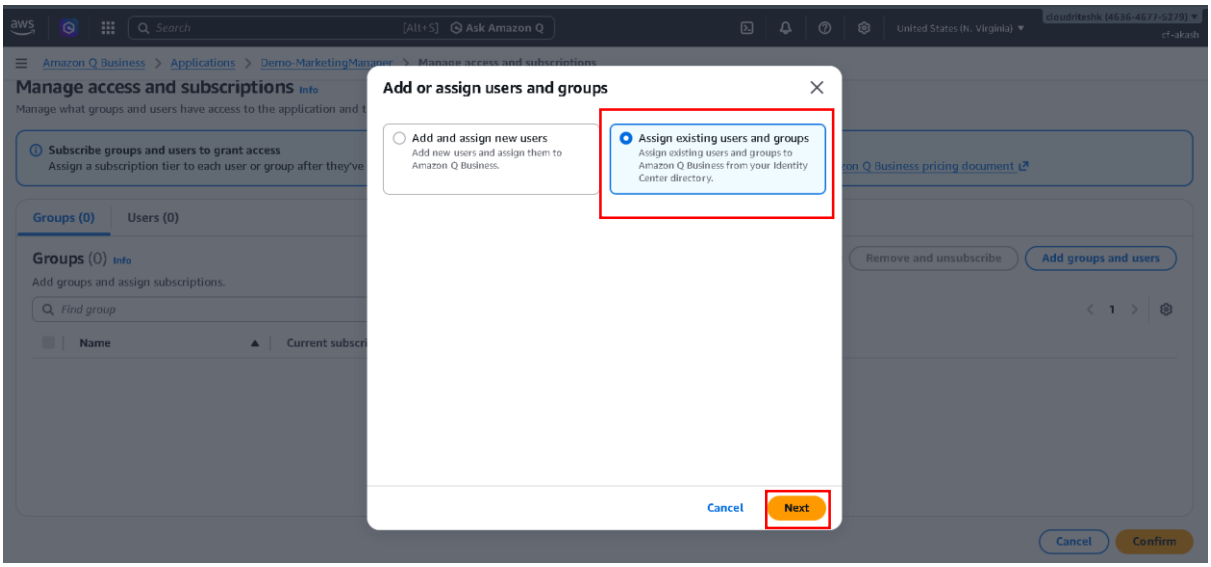
- Now we are on our access Portal but there is no any app right now and that's because we are not added Amazon Q Business



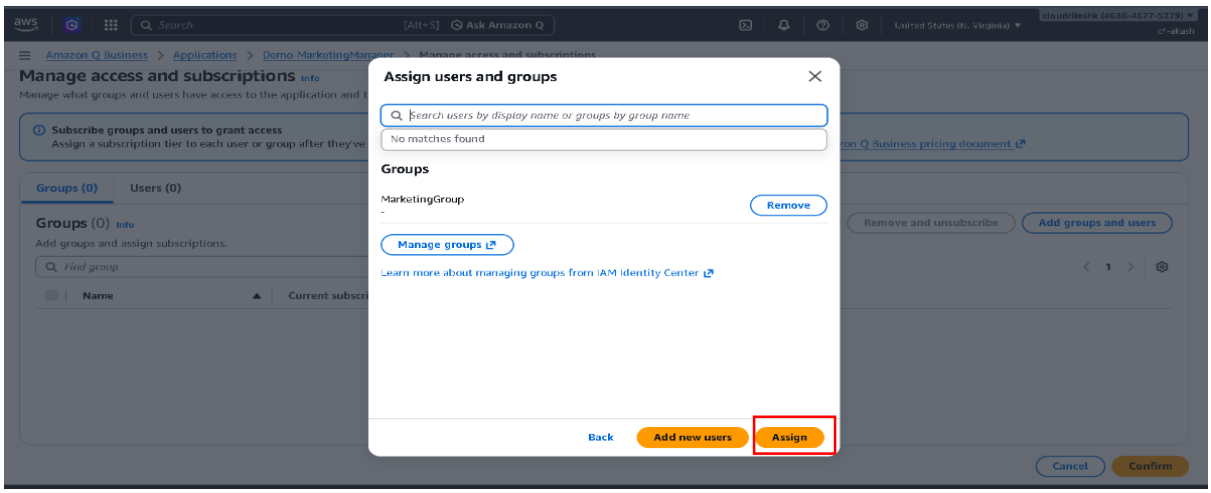
- Now Go back to your Amazon Q Business application and click on Manage user access



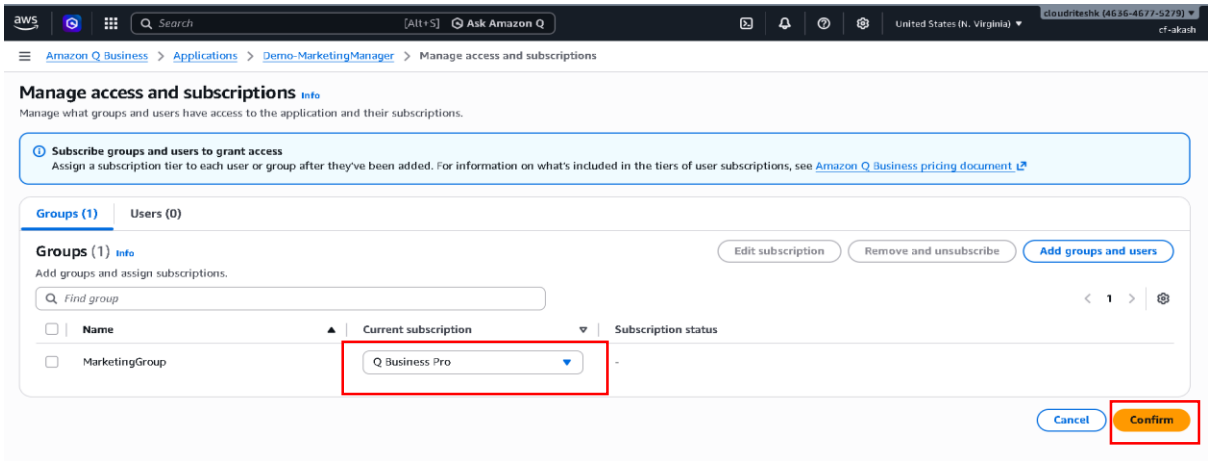
- Click on Add Group and user



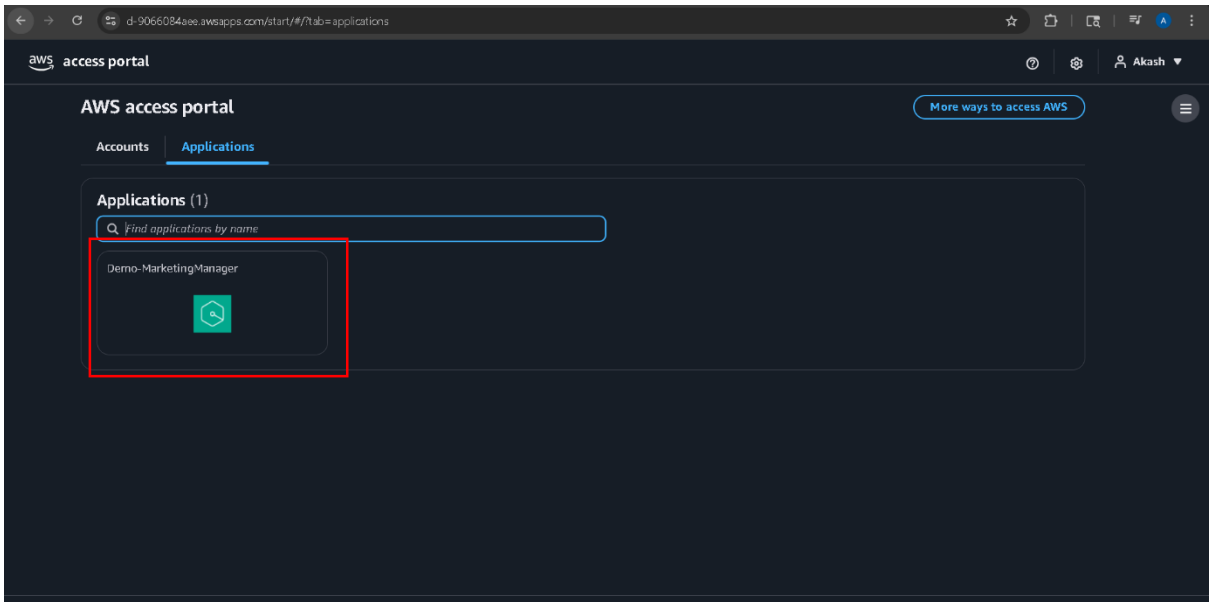
- Choose Assign existing user and group
- Click on next



- Search your created Group and select
- And now click on Assign

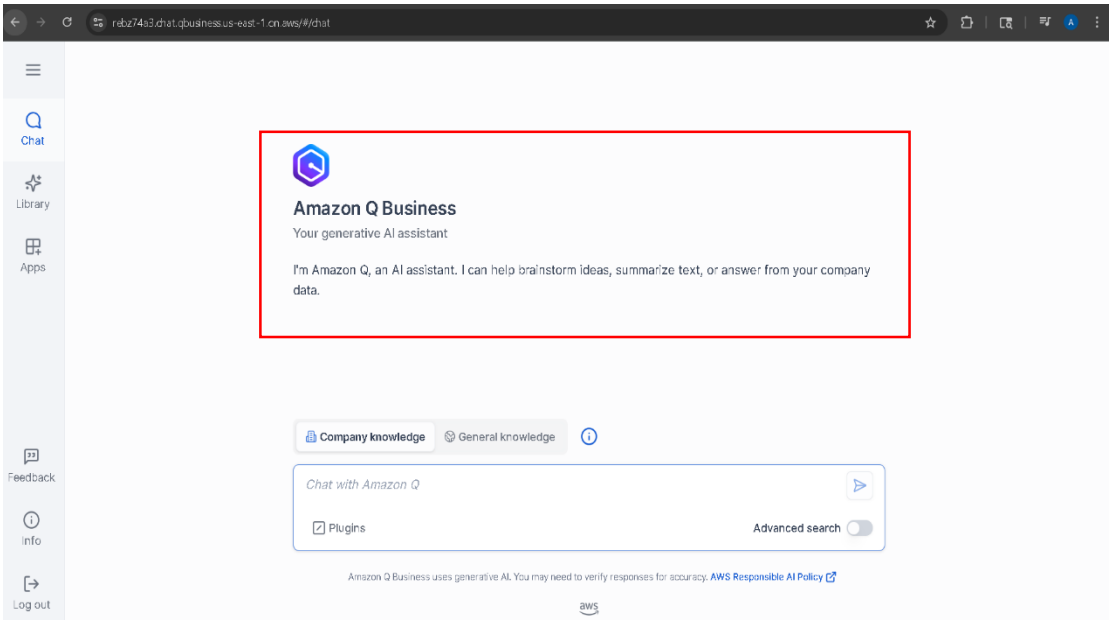


- Current subscription Q Business pro (In this Cost involve)
- Click on confirm
- Now again go to access portal and refresh

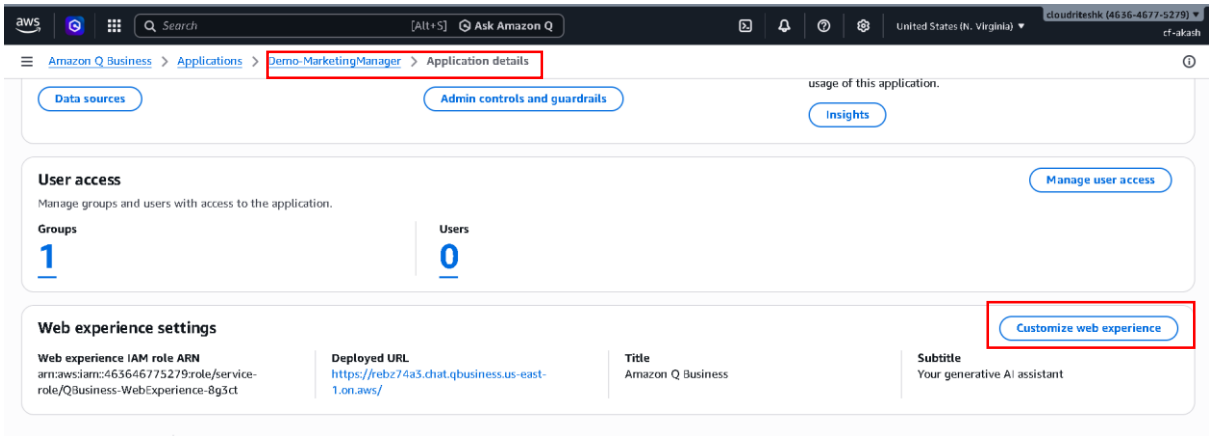


- Now you can see it's showing me demo MarketingManager app that we just created.

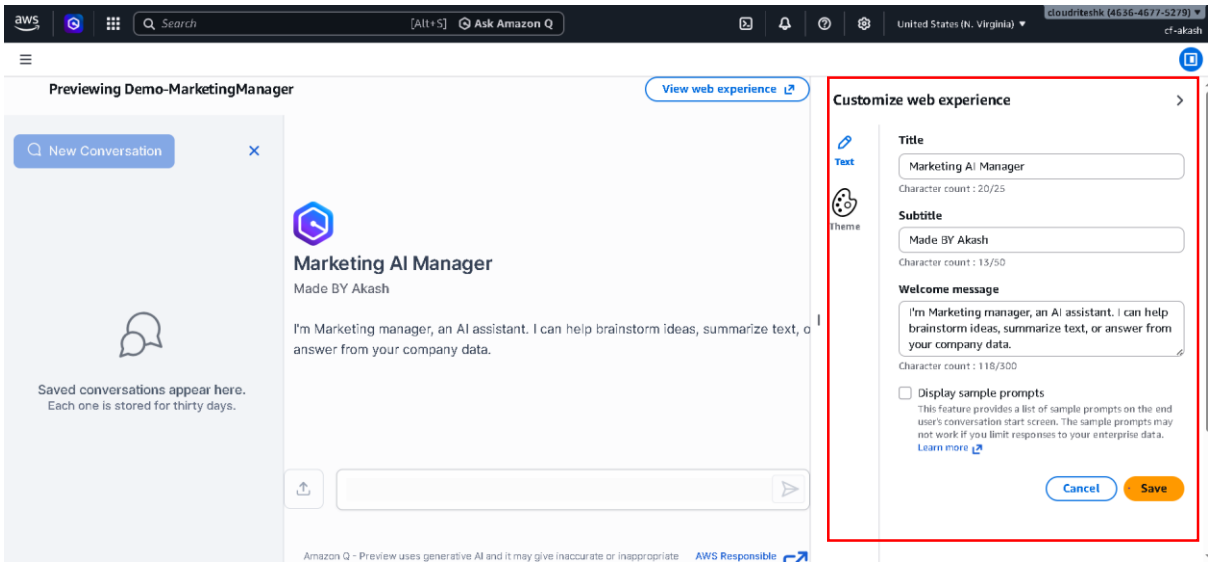
- Click on app



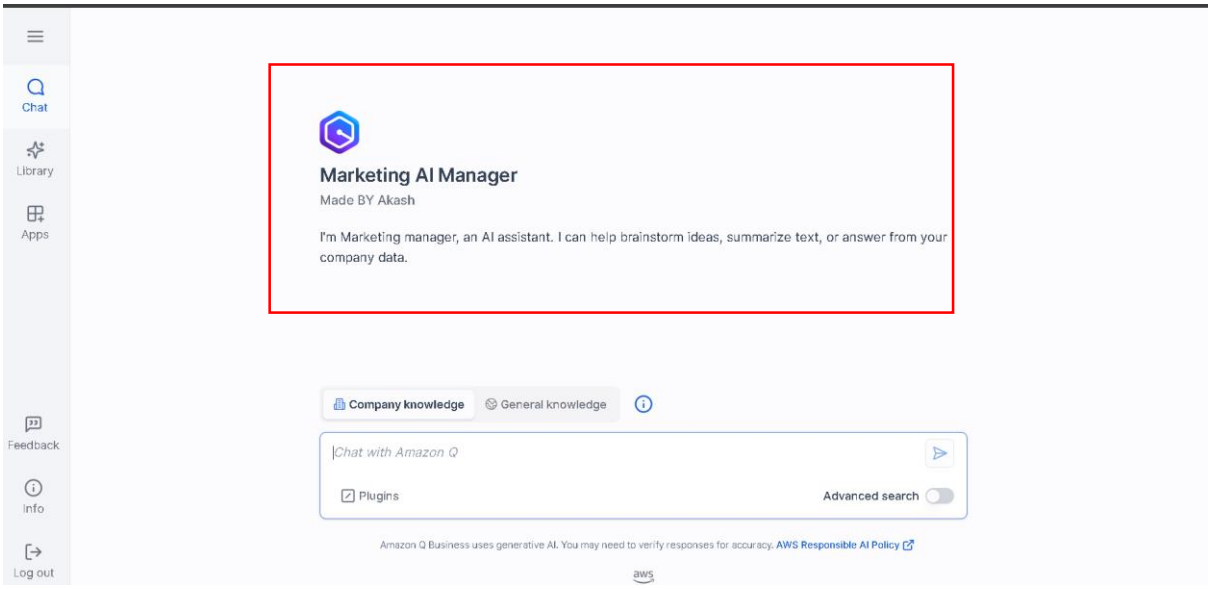
- Our app is fully Ready
- Now Add some customization on application
- Go on Amazon Q Business Console in your application



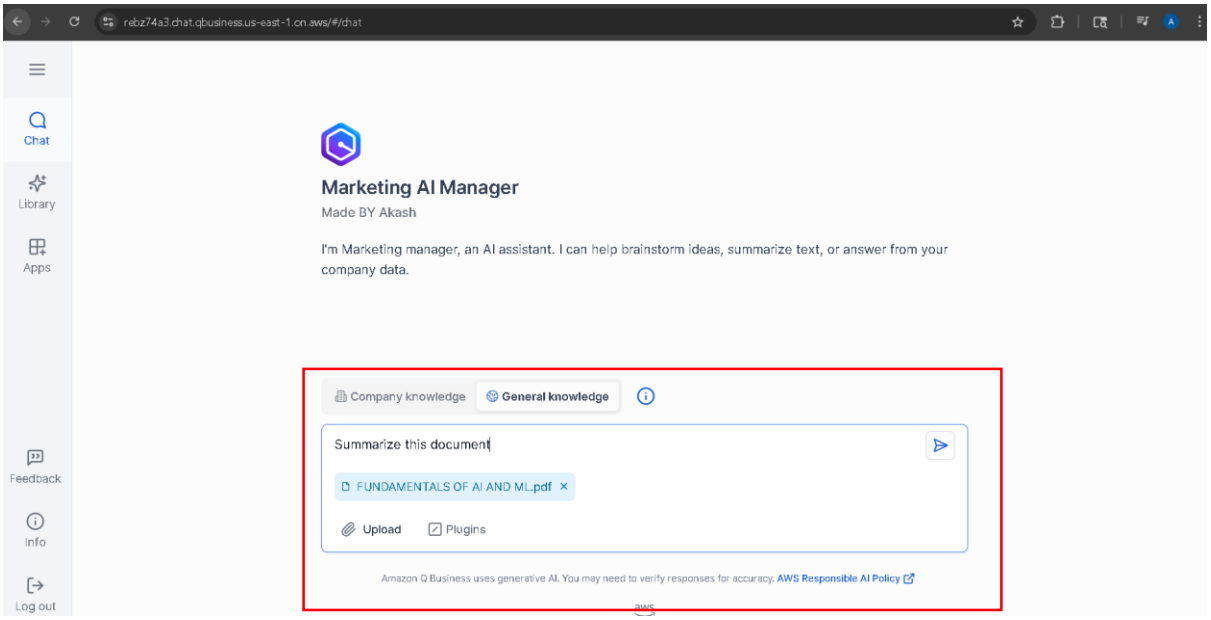
- Now click on Customize Web Experience



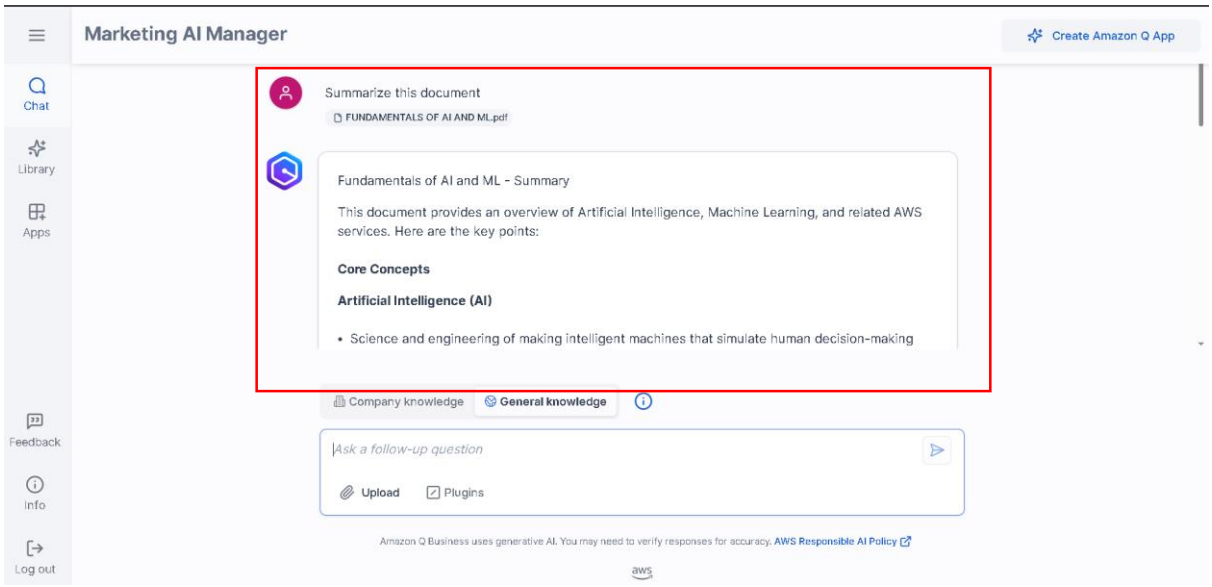
- Now here you customize whole things like
  - Title
  - Subtitle
  - Welcome Message
  - Theme
  - Color



- Go back to your created Application and refresh it
- Now you see Changes is applied
- Now you can do any things



- Now your Application is properly working
- I give him one task to summarize the give Pdf as prompt



- Now you see this they summarize the whole document

- You can also go an app section and create apps

- They are perfectly working
