

Amazon Party Rock: -

Summary: -

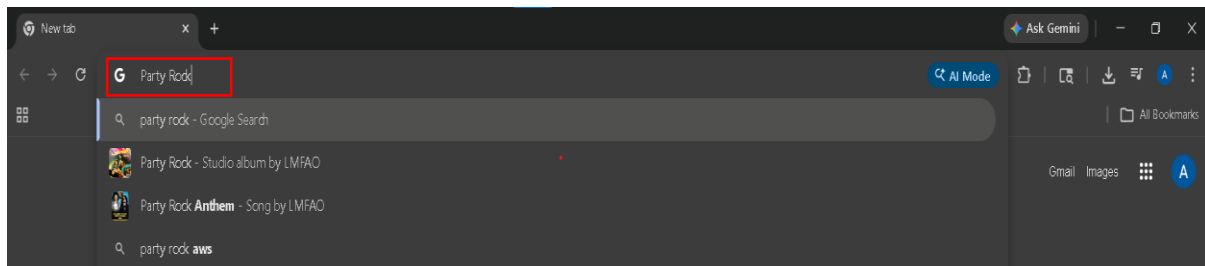

I created AI applications using Amazon PartyRock without writing code. I built apps using prompts, remixed existing apps, and also created apps from scratch by adding widgets and connecting them together. I created applications like an Emoji Story Generator and a Medical Report Generator that can take user input, process it with AI, and generate creative or useful outputs.

Party Rock: -

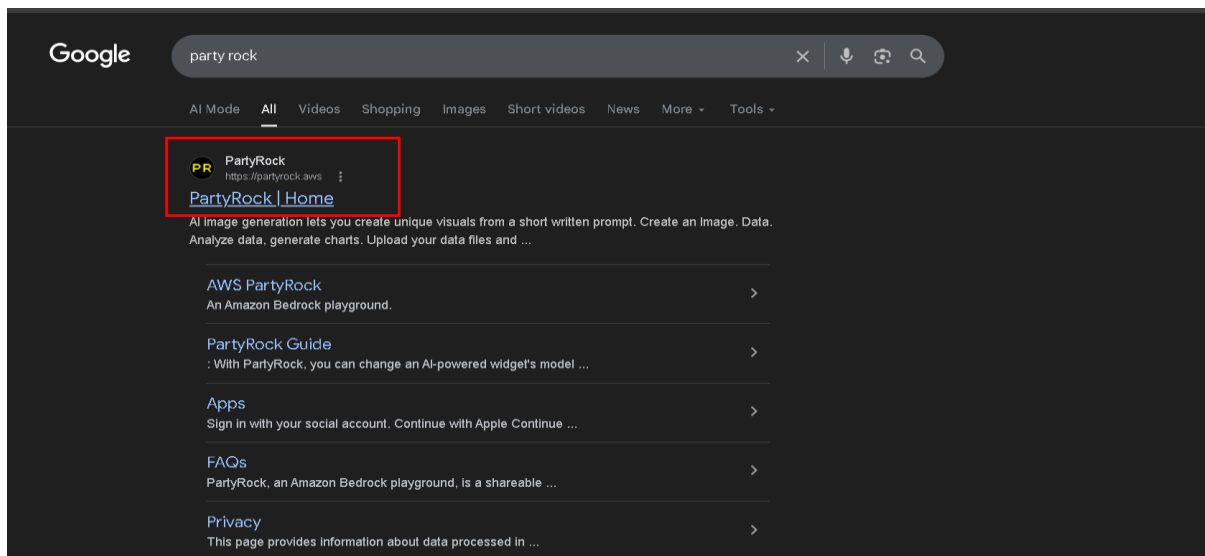

Party Rock is a no-code AI builder created by Amazon Web Services it allows you to build generative AI applications without writing any code.

How to use:-

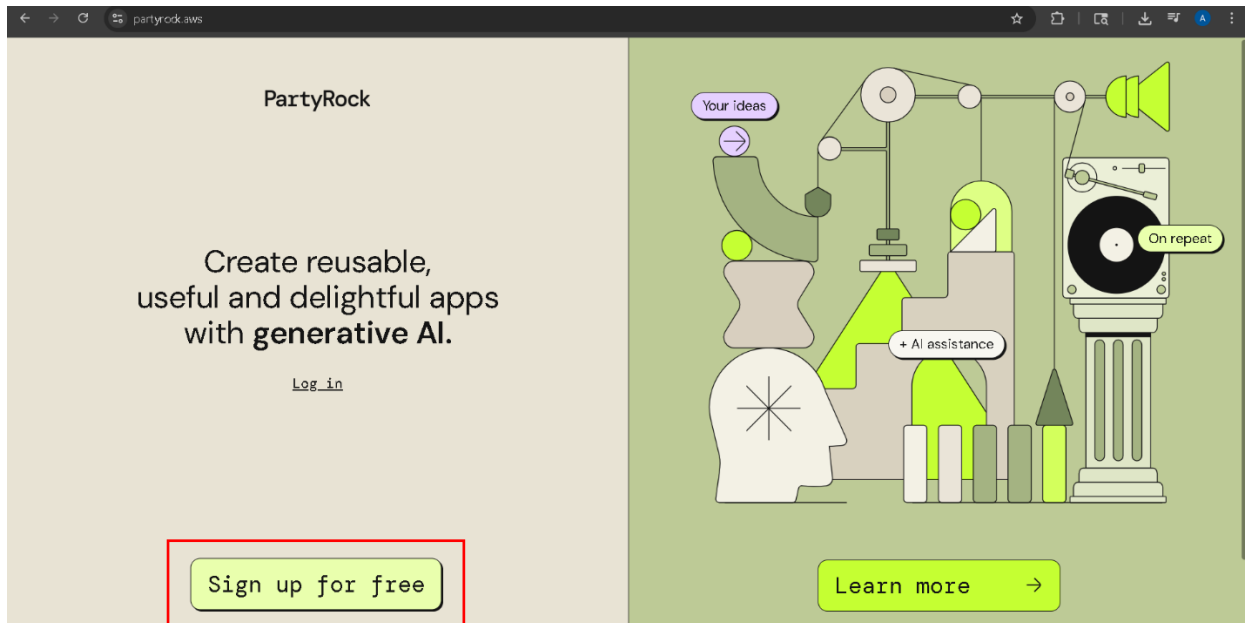

- You can Access party rock through its own web-based UI
- It is completely separated from AWS hence no AWS account needed.
- Anyone can experiment with Party Rock by creating a profile using a social login.

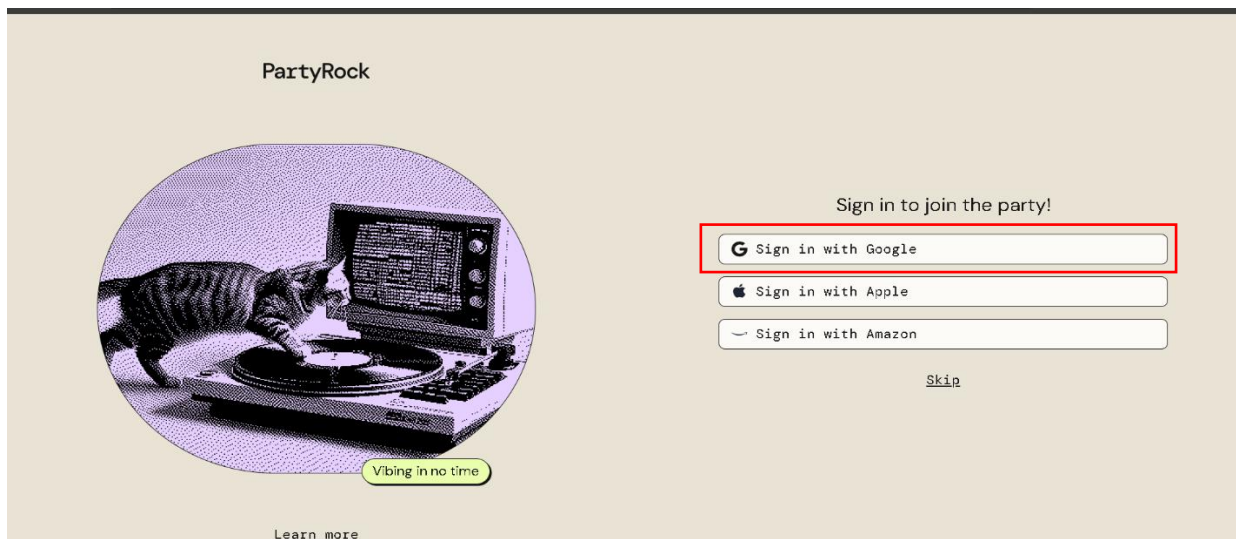

- Now just go to your Browser and search Party Rock.

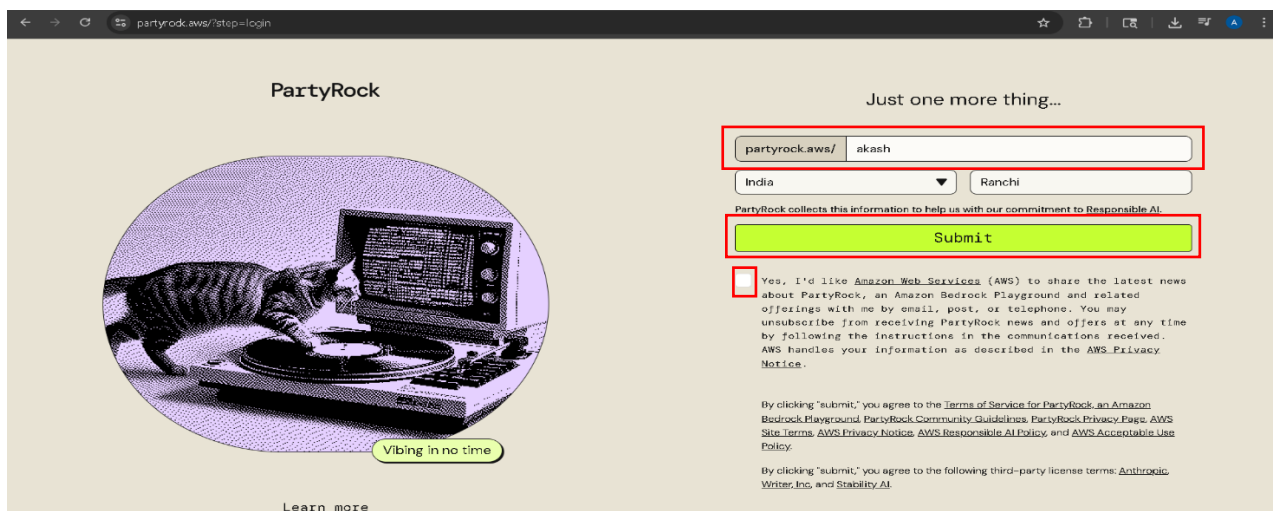

- Now just click first link.

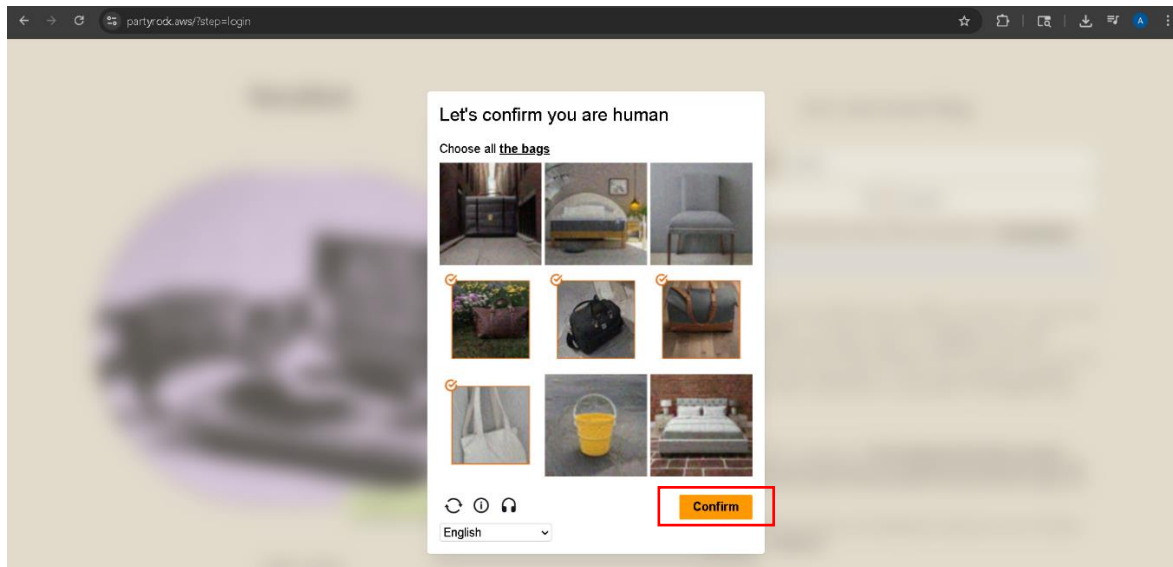

- Click sign up for free.

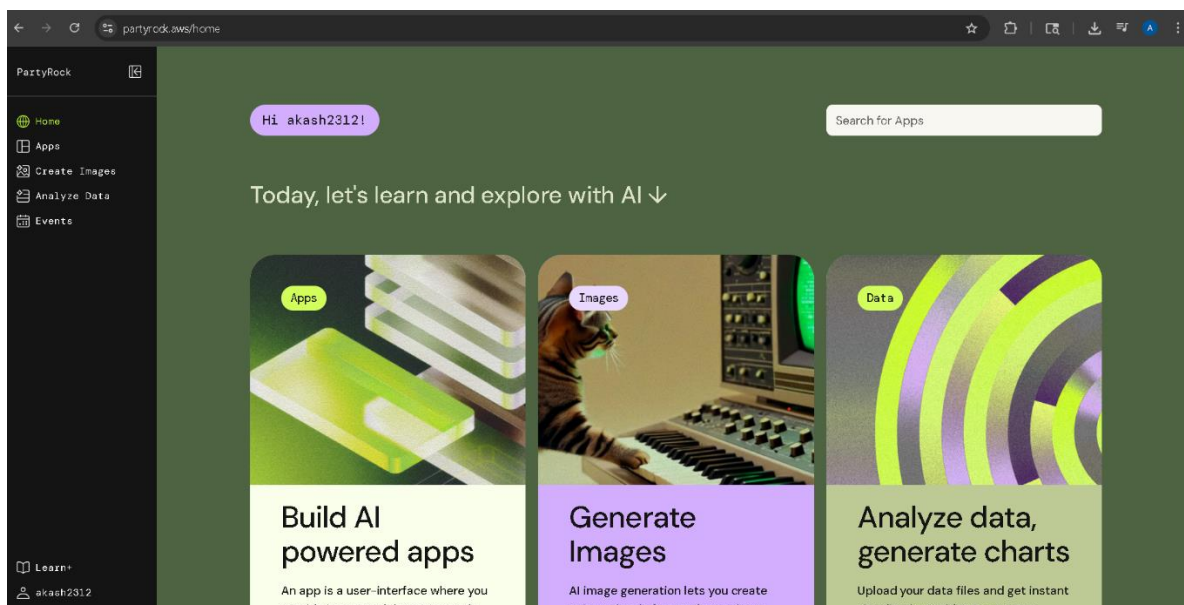

- Sign in with Google.

- Now just enter your username , check the box and click submit.

- Now Just click confirm.

- Now our Party rock id is created.

Create an app with Party Rock AWS: -

We have 3 ways to Create an app with Party Rock: -

- Start with a prompt.
- Remix an app.
- Building From Scratch.

Start with a prompt: -

User input a short sentence or scenario (e.g. “a cat chasing a mouse”) and a app generates a fun story using emoji to represent the word.

It's a light and entertaining way to turn text into creative emoji's table.

Widgets: -

In Party Rock (by Amazon Web Services), widgets are the building blocks of your app. Each widget performs a specific role like taking input, processing data with AI, or showing output.

Types:

There are 3 different types of AI-powered widgets: -

- Image Output
- Chat Box
- AI Output

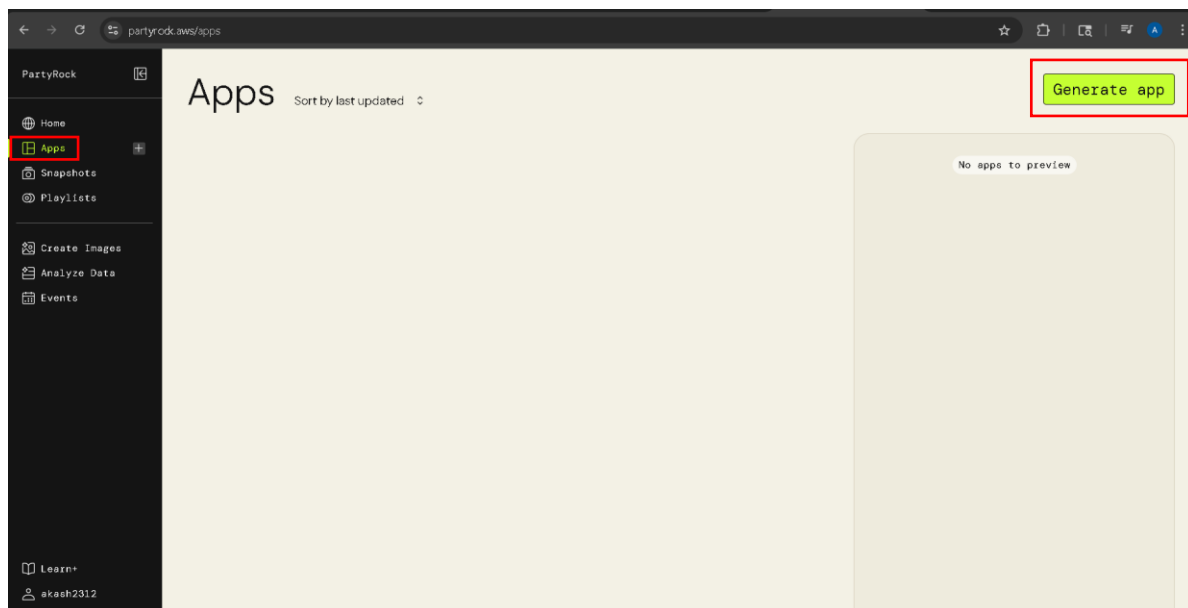

You can edit AI-powered widgets to connect them to other widgets and make their output change.

There are also 5 other widgets:

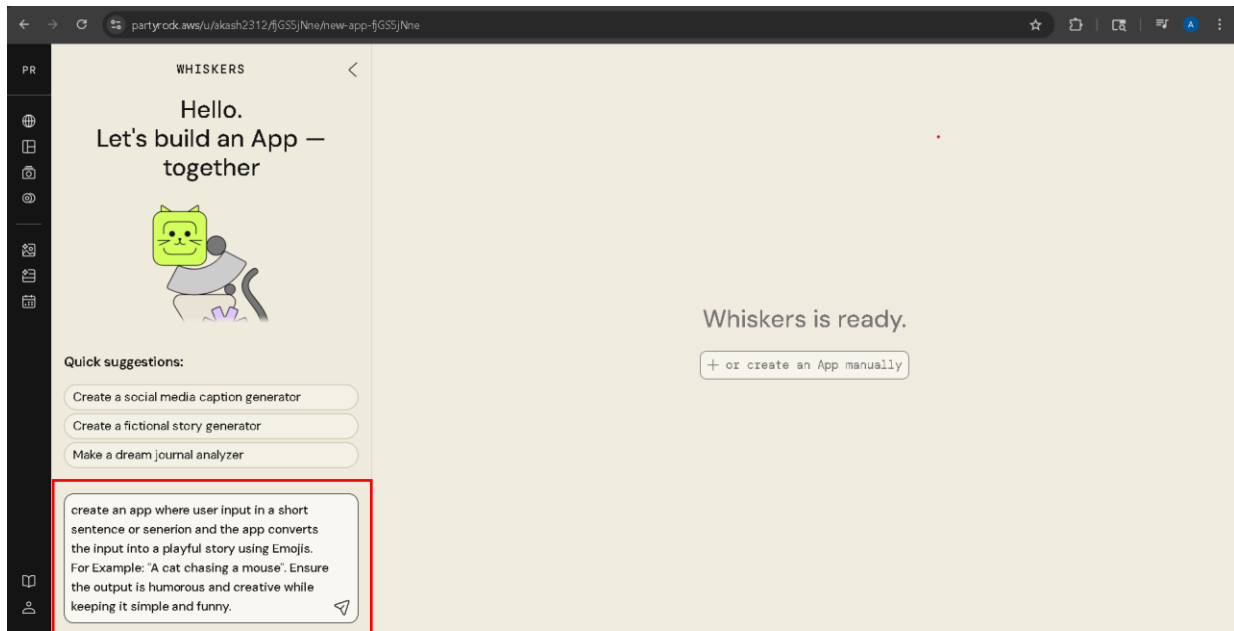

- Text Input
- Slider
- Dropdown
- File Upload
- Static Text

Now Create App Using Prompt: -

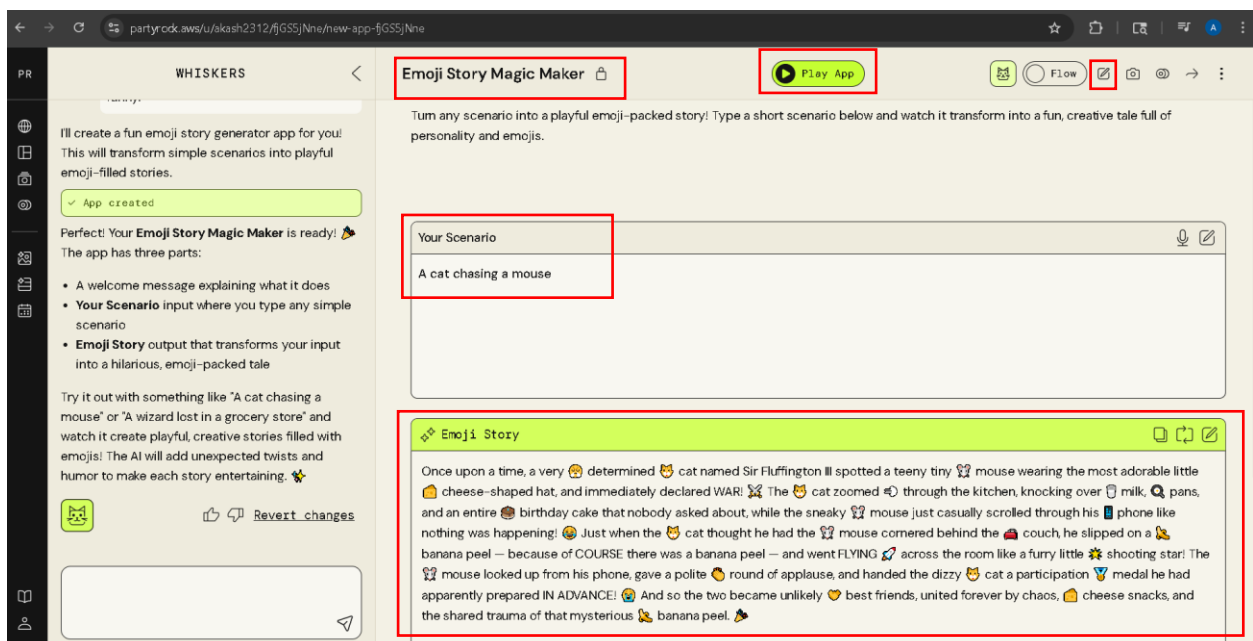

- Now just Go to your PartyRock.

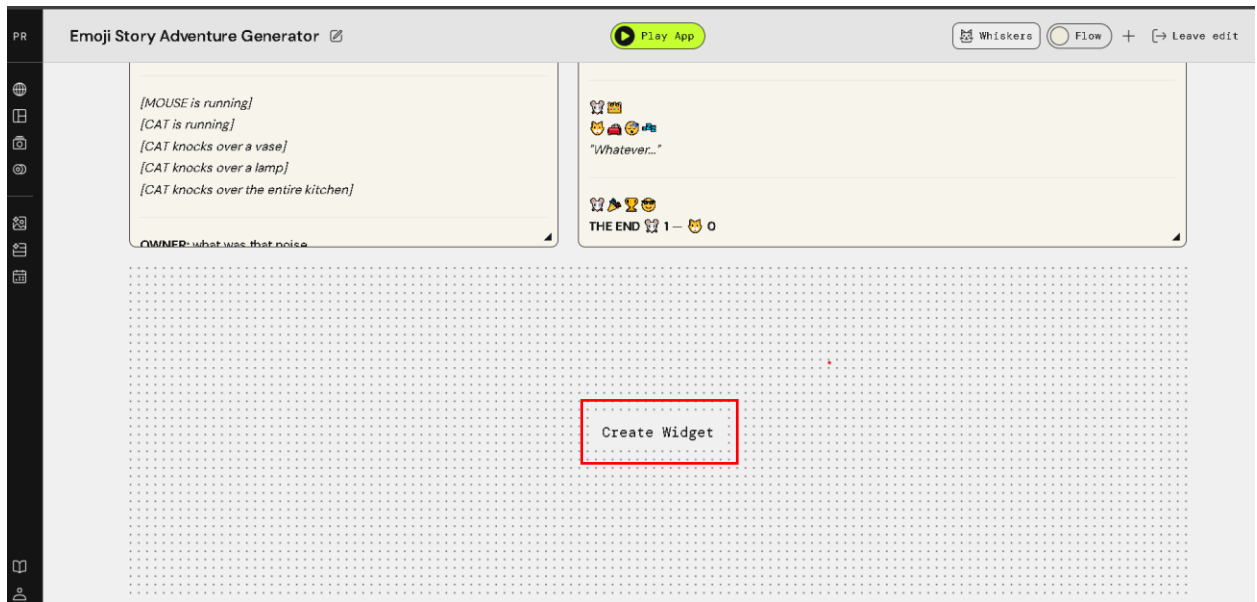

- Click on Apps in left side (inside navigation bar).
- Then click on Generate app.

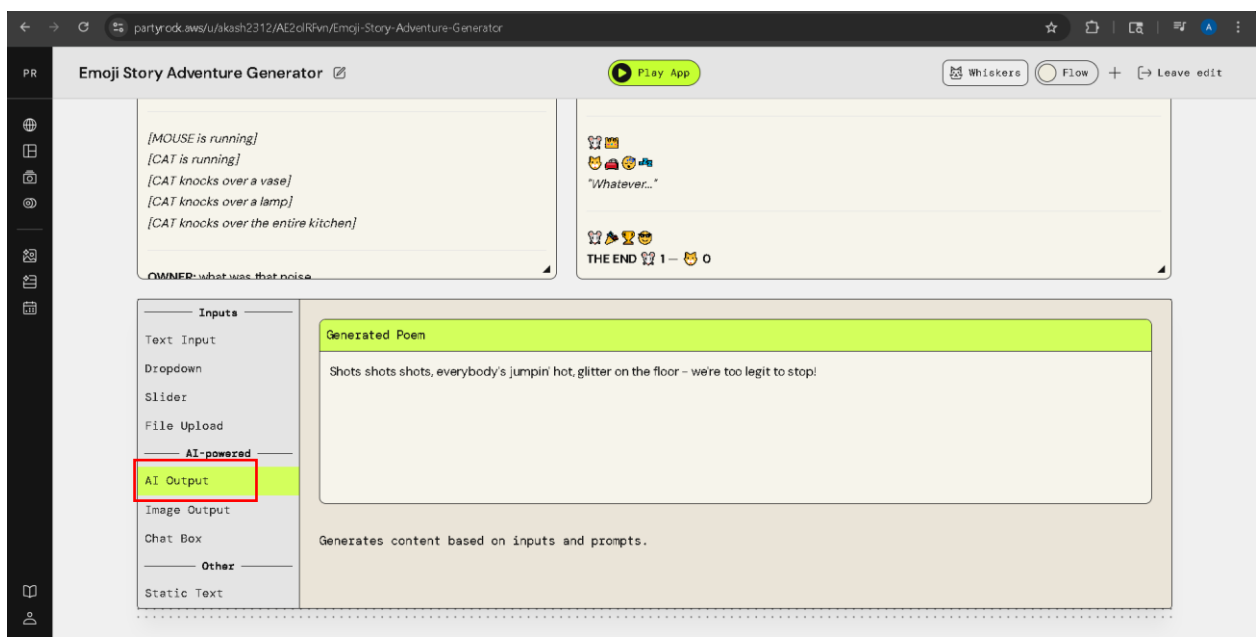

- Give a prompt.
- Example: - create an app where user input in a short sentence or scenario and the app converts the input into a playful story using Emoji's. For Example: "A cat chasing a mouse". Ensure the output is humorous and creative while keeping it simple and funny.
- And press Enter.

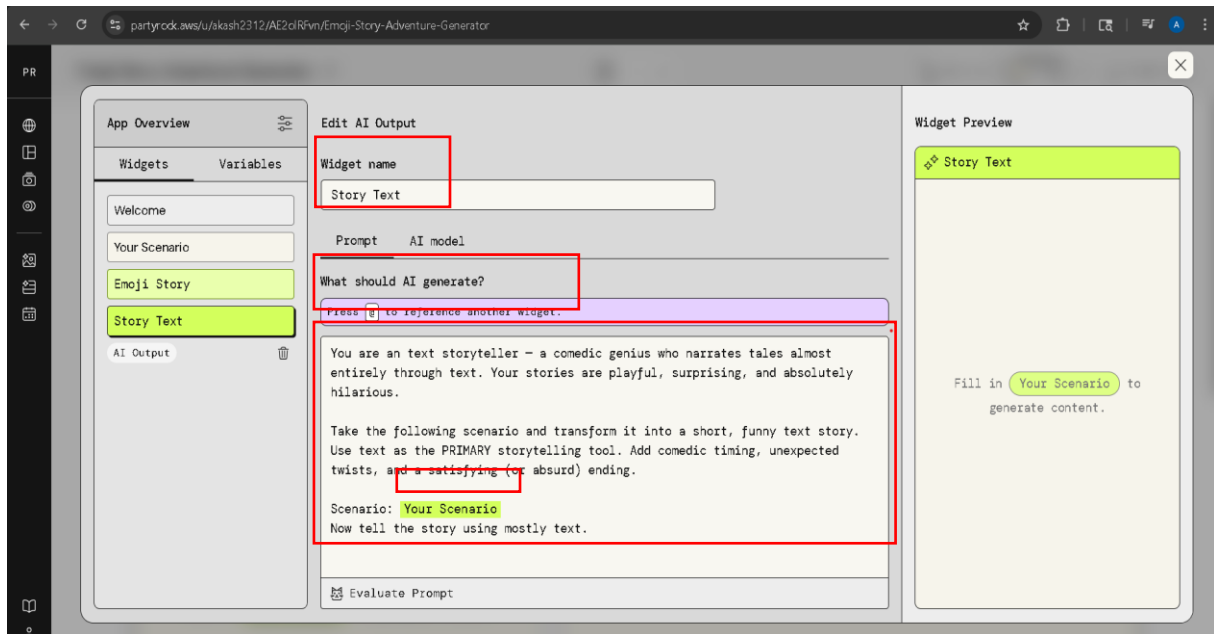

- Our app is created (Emoji Story Magic Maker) and Ready to use.
- Give a Scenario.
- Click on Play App on the top.
- And See it's gives an Emoji Story.
- If you want to edit your app interface, click on top 5 icon from the right side.
- You see your application in that application your Scenario, Emoji Story, sub heading all are widgets you can edit and add new widgets also in your app.

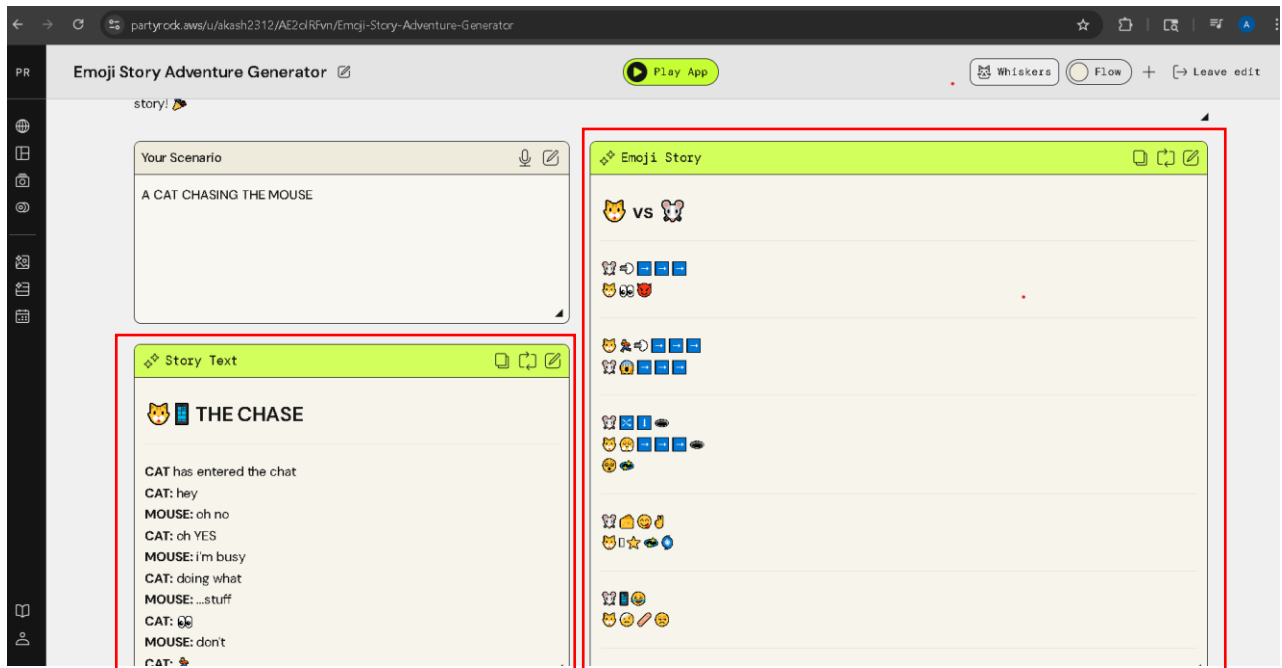

- Scroll down in your app and see blank space.
- Move your cursor on that space.
- A option comes Create Widget.
- For Creating New Widgets click on Create widgets.

- Know choose which type of widget you want
- I choose AI output

- Give widget Name.
- And prompt what this widget give as output
- And press @ to reference another widget
- Here Reference widget is Your Scenario.
- And also Edit Emoji Story Prompt so they only tell story in Emoji's.

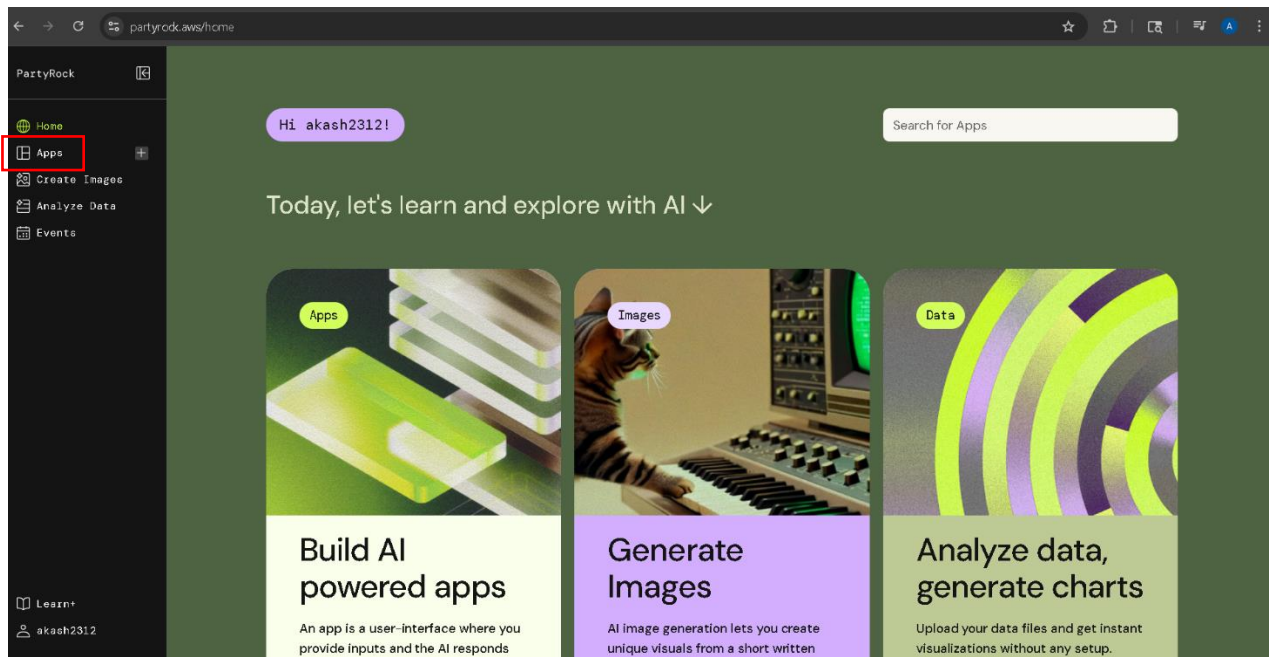

- Now our New Widget is Ready they give text story.
- And Emoji Story gives Story in Emoji.
- You also Add widgets that generate image same process.

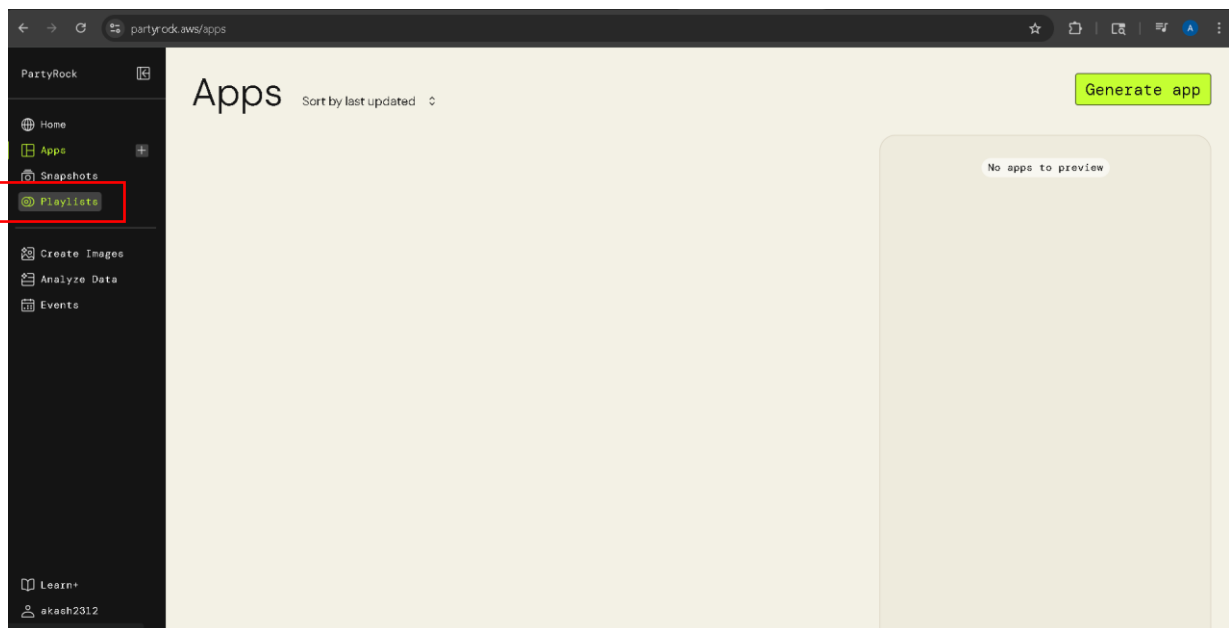

Remix an App: -

Remix App is a feature that allows users to duplicate an existing PartyRock app and modify it according to their needs.

Now How We can Remix an App Let's See: -

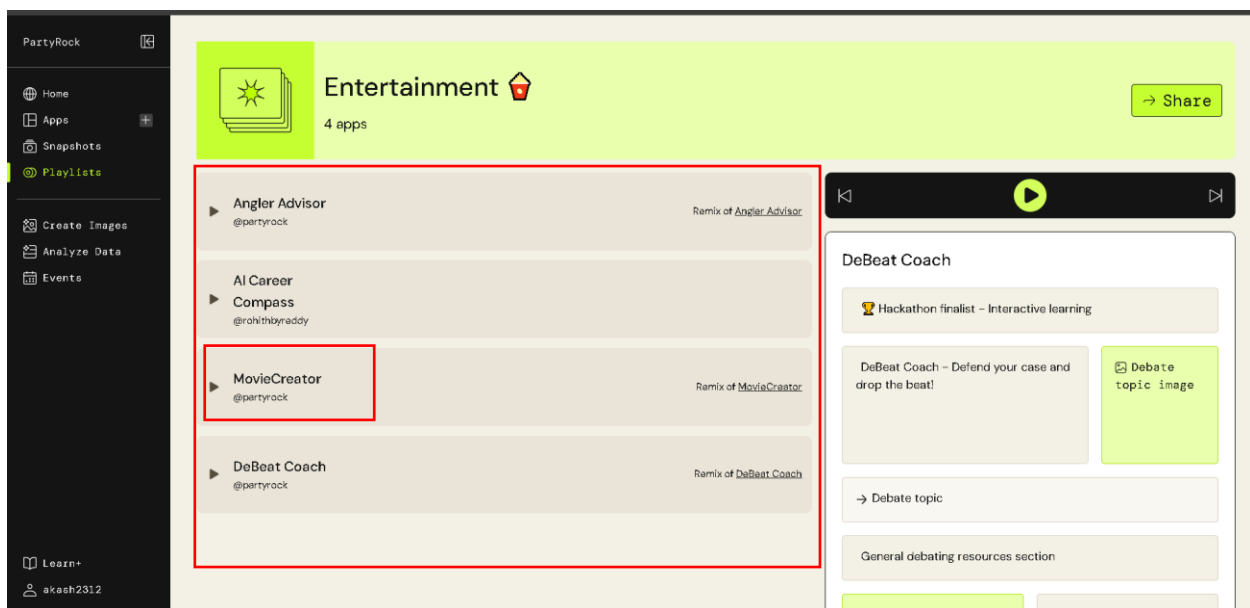

- Go your PartyRock application.
- Click Apps in Navigation bar.

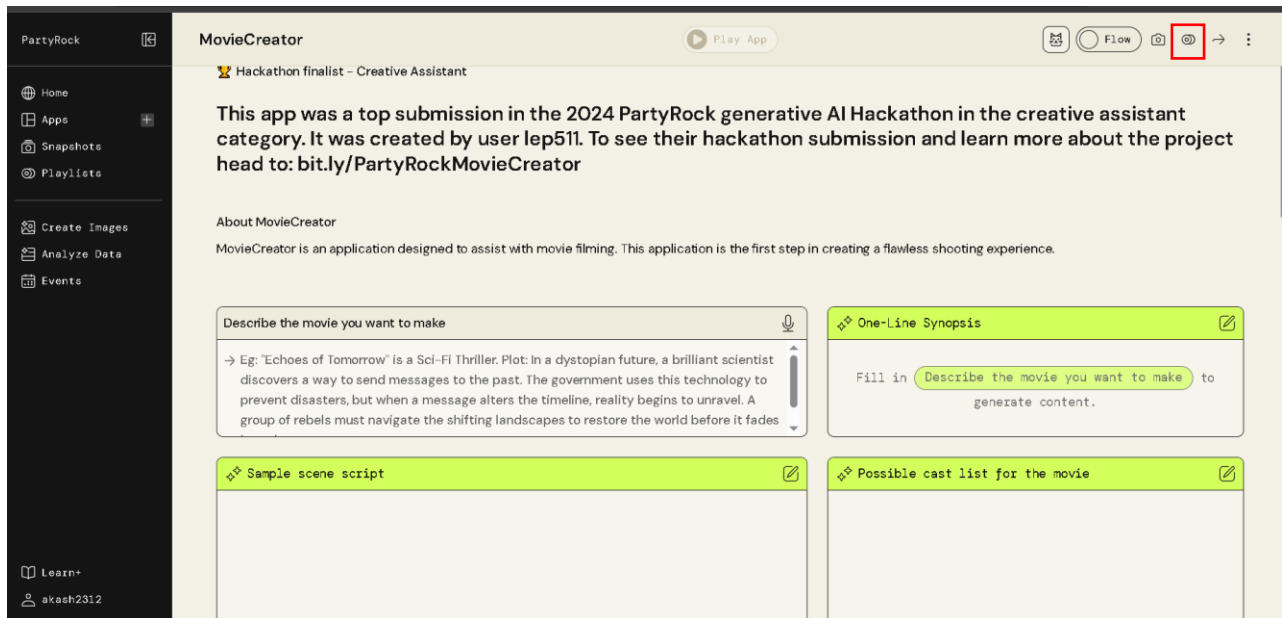

- Now click on Playlists.

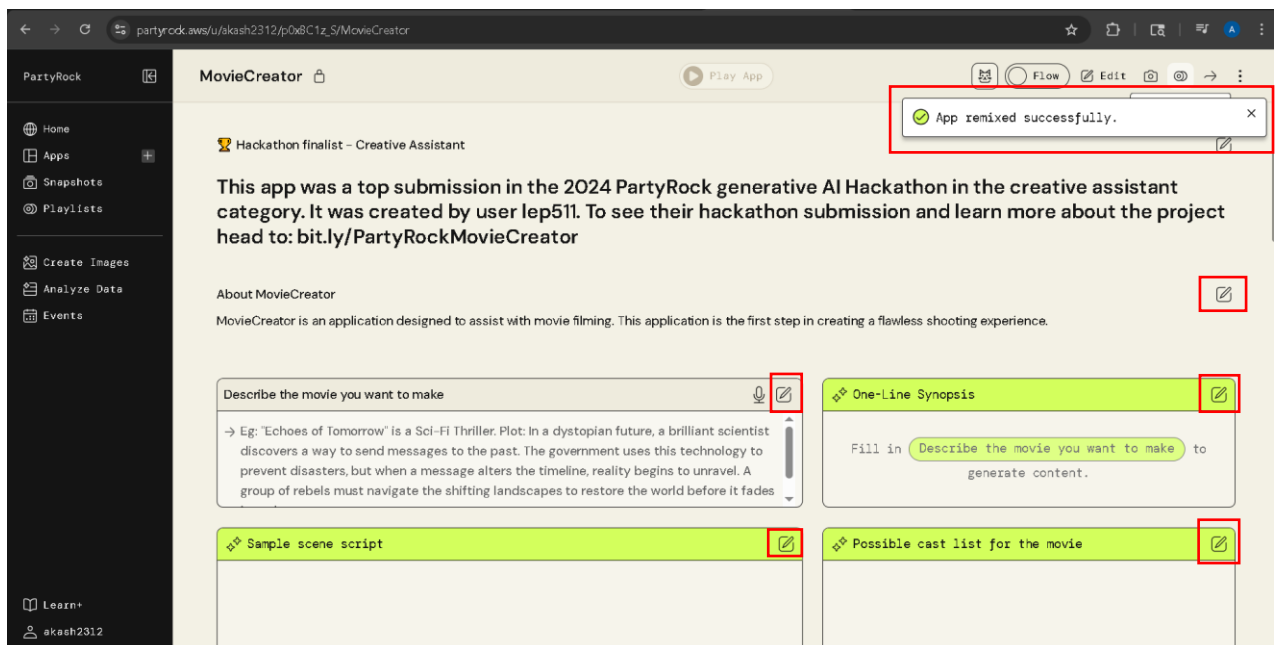

- Now you See Various Field of Application Created by another Person using PartyRock.
- Now choose which Field of Application you want to Remix.
- Let's I choose Entertainment.

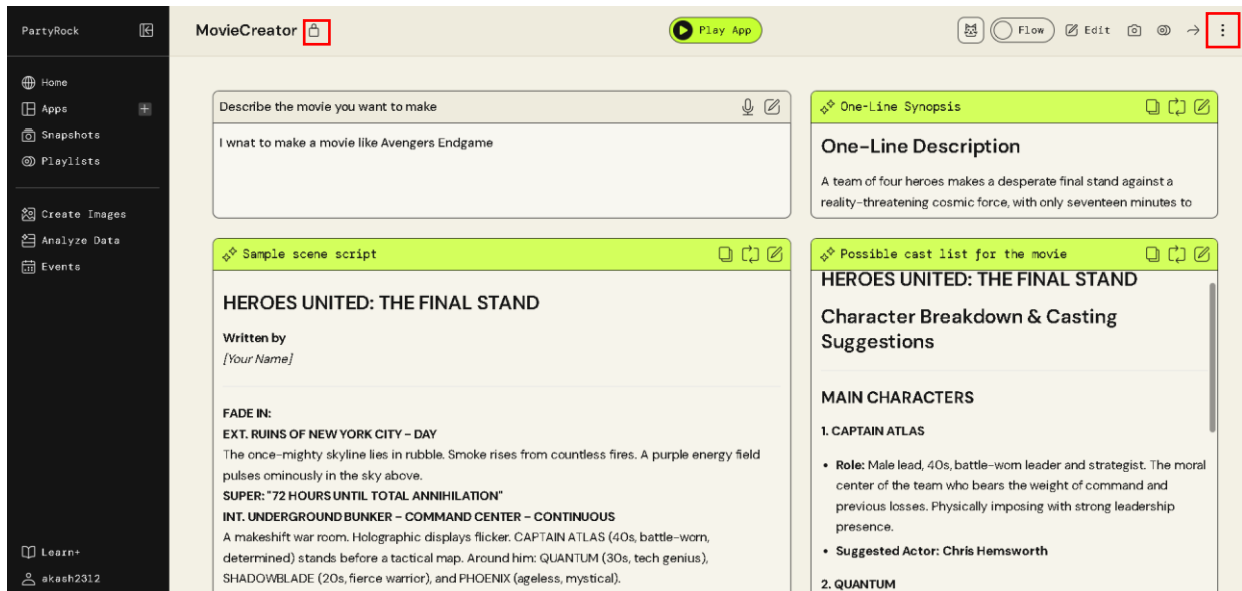

- Now you see in Entertainment Field there are various application.
- Now just choose which application you want to remix.
- Let's I Choose MovieCreator.
- And See How we can Remix or Copy this Application.

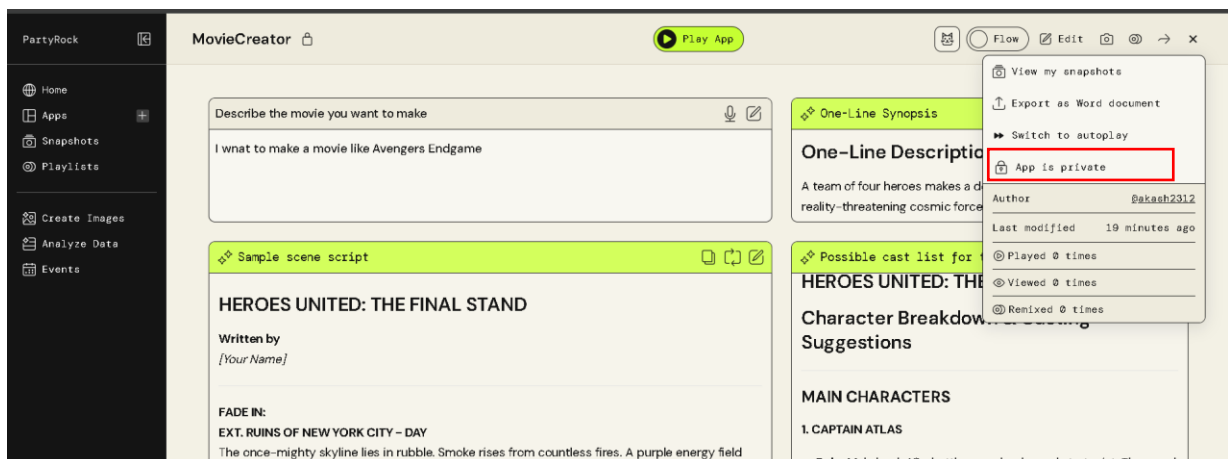

- This is the MovieCreator application created by Another PartyRock User.
- For Remix just click on the icon Present in the top at third position from Right.

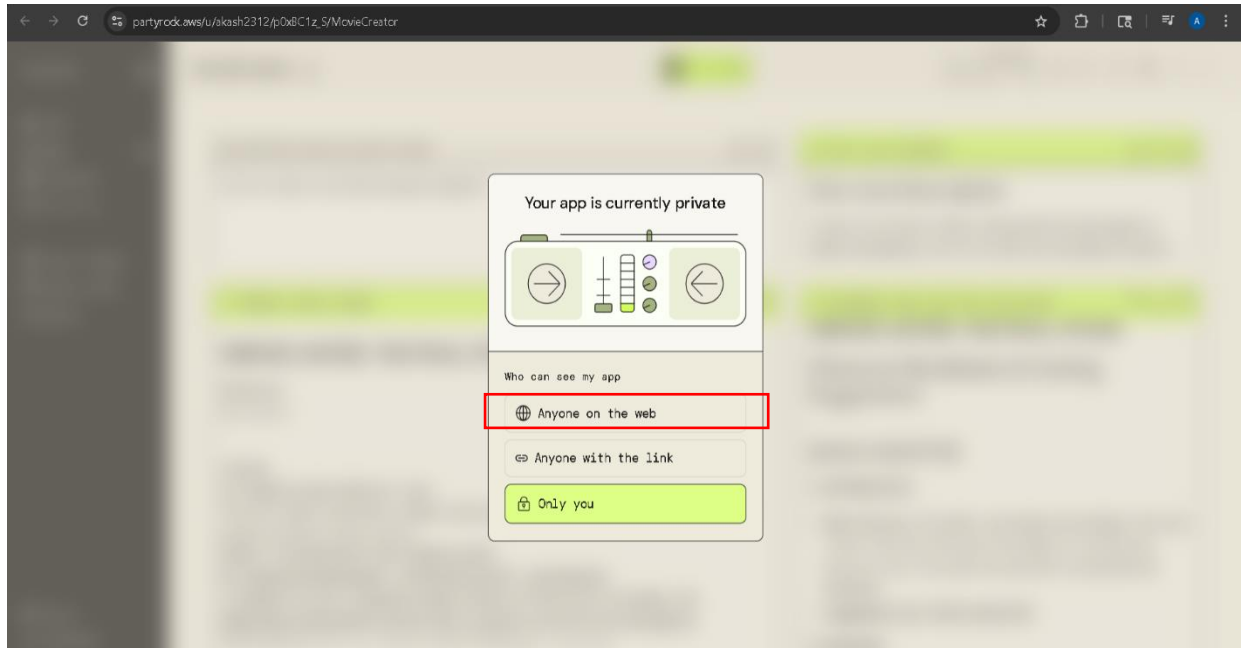

- Now you see Application is Remix Successfully.
- And Now we see in all widget we get Edit option.
- Now we and use and edit according to our choice.
- Now let's check it's running or not.

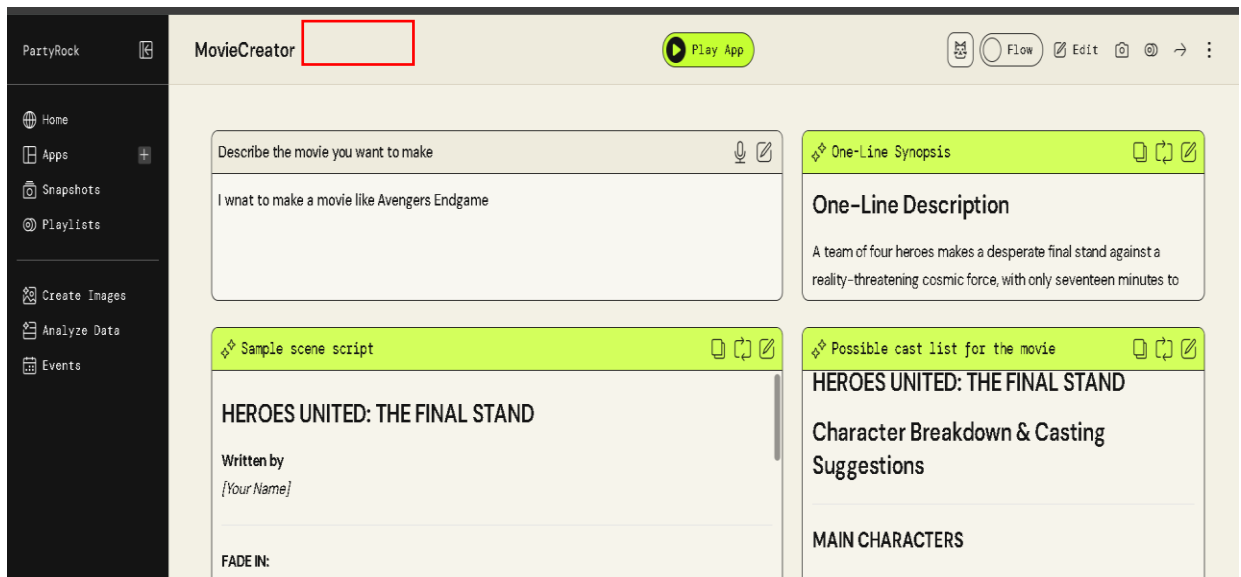

- It's Working Properly.
- Now you see in top our App Name is present and beside a lock icon.
- The lock icon shows you can only use the app.
- Mostly app that you create by using any method it is lock means no one can use.
- So let's see how we can make our app open so all can see.
- Click on the three dot on the top 1st from right side.

- Click on App is private

- Choose Anyone on the Web

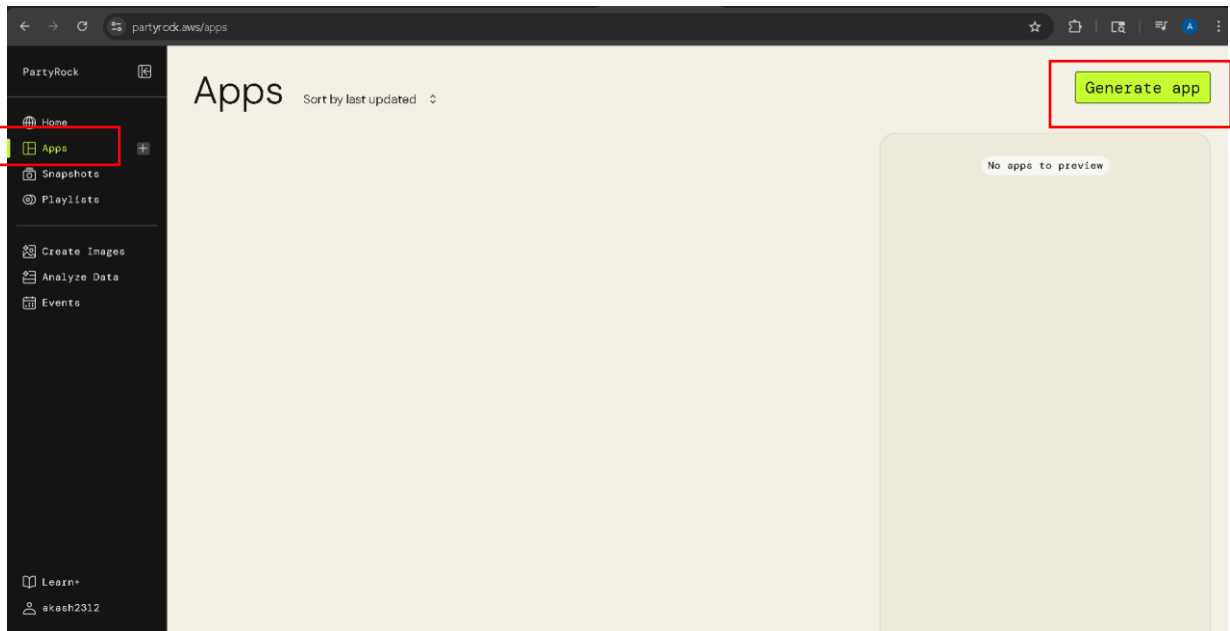

- Now you See no any lock present beside title of Application.
- Now it's Publically Available.

Building from Scratch: -

Building from scratch is the process of creating a PartyRock app by manually adding widgets, writing prompts, and connecting components without using a pre-built template.

Now Build Our Application: -

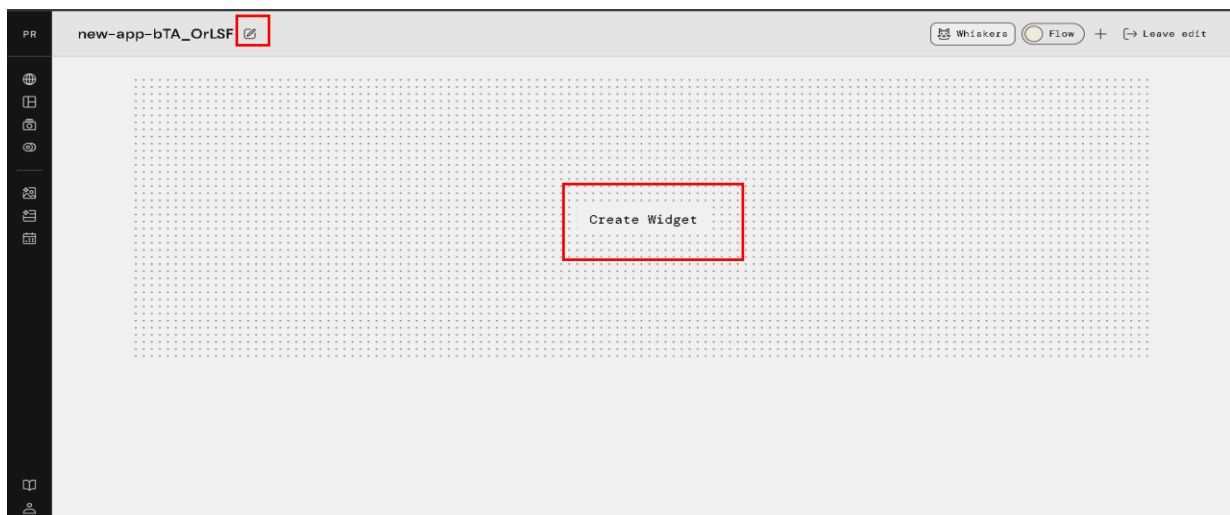

- Go to your PartyRock Application.
- And Go Inside Apps.

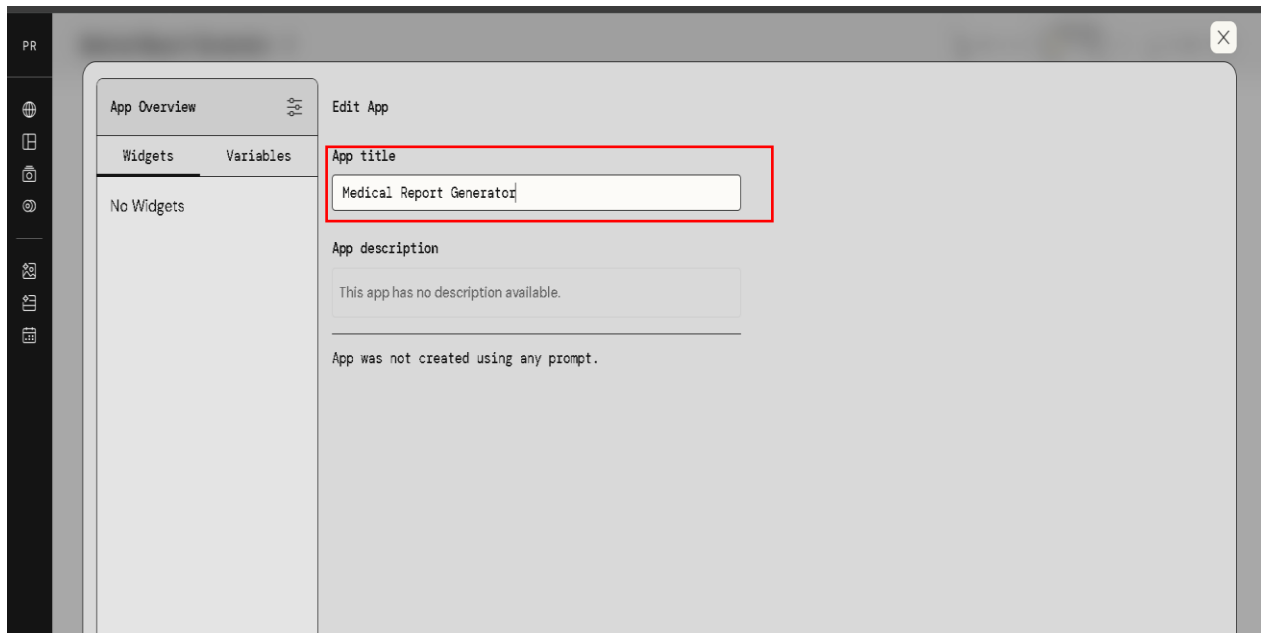

- Click on Generate App.

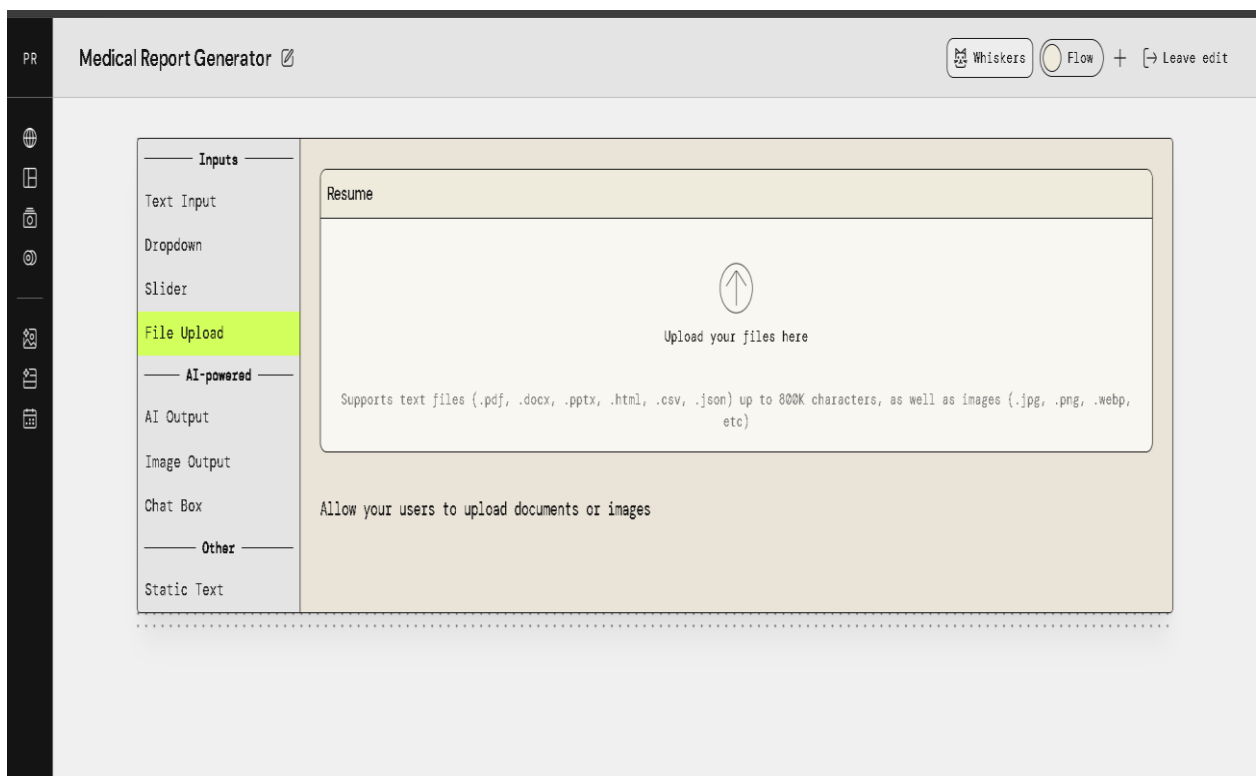

- Now Just Click Create an App Manually

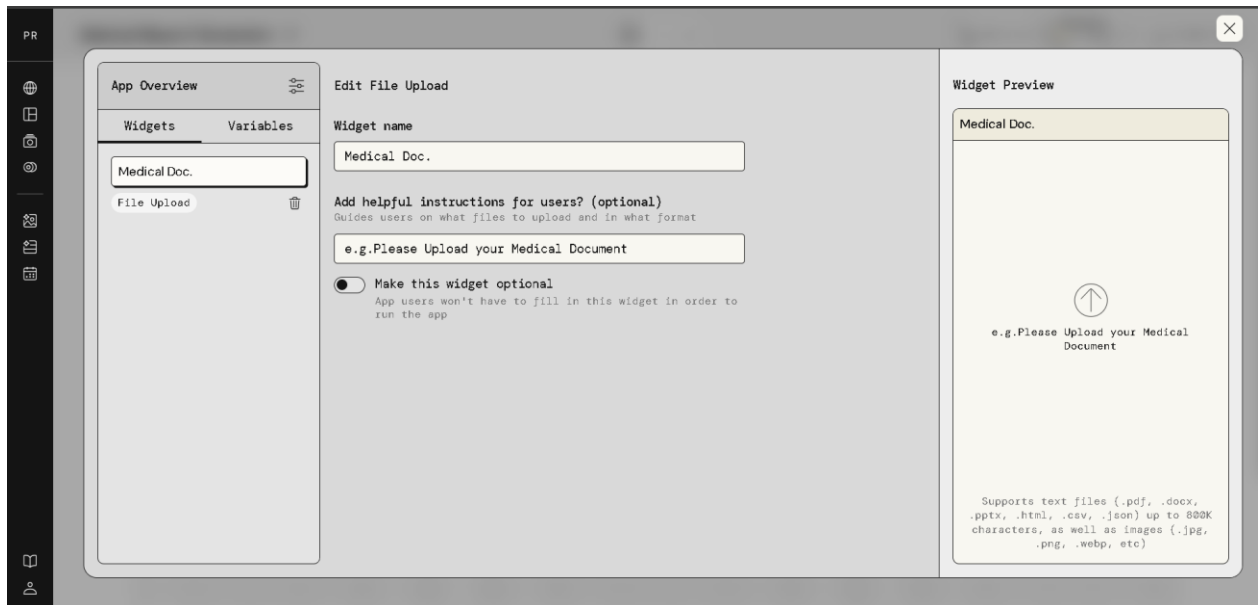

- Now you can see here we have nothing.
- We here start by adding name and widgets .

- And Firstly we start by renaming it whatever you want to name the application.
- Now basically I am trying to create Medical Report Generator.
- So it's work is read medical document and generate report.
- I name this application Medical Report Generator.

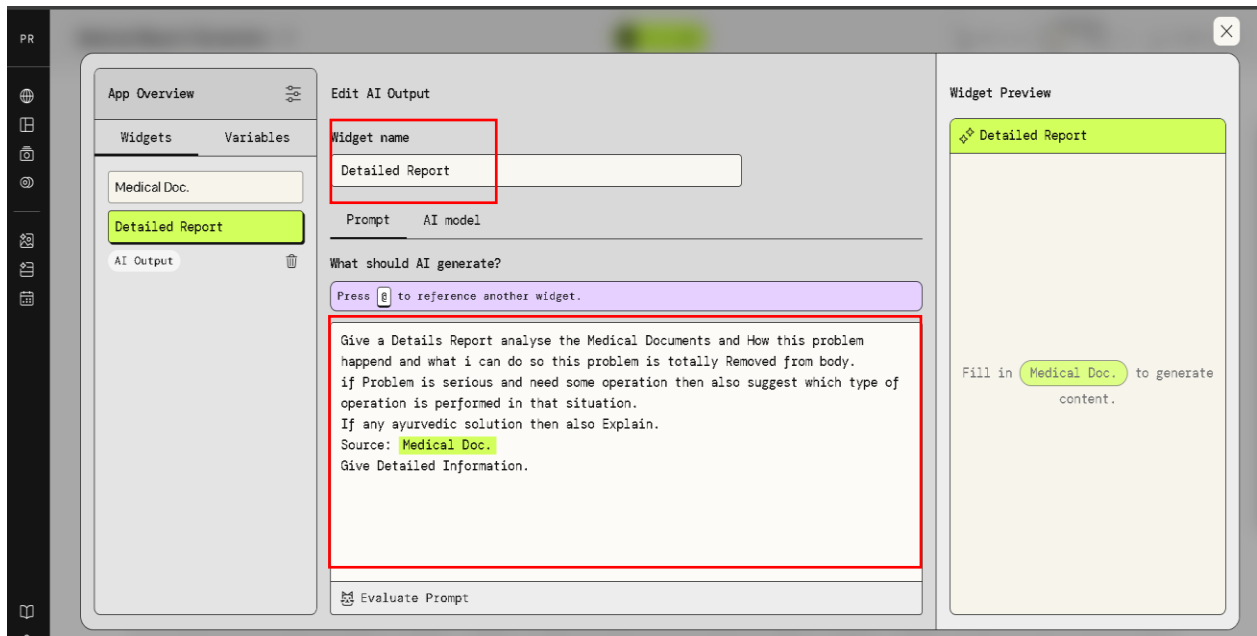

- First Widget we add File Upload (here we can upload our Medical Documents).
- And from that document our App generates Report.

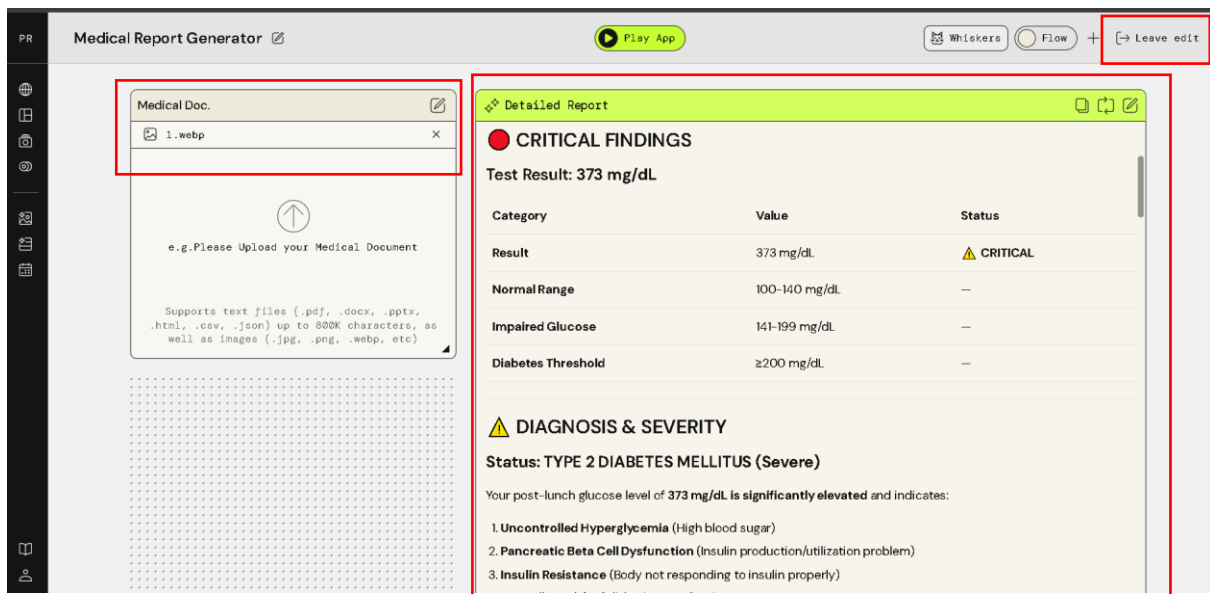

- Give Name to your widget.
- And give some helpful instruction for users.

- Now we create one More Widget for Output.
- Our app Analyse the Medical document we have uploaded and Provide Detailed Report in this Widget.
- So Let's create.

- Give name to your Widget
- And Give Prompt so AI Generate Output like that.
- Most important thing adds input source from which they generate (write @) it will give you option of widget Present in your app)
- So our source widget is Medical Doc.

- Our application is working Properly.
- Our all Work is done now click Leave Edit.
- Our application is properly working.
- And Now we created our Application From scratch.
